12. Interface

Preset Pin: The preset function can be used to adapt the encoder position to the mechanical alignment of the system. By performing a preset, the actual position value of the encoder (both, single turn and multi turn) is set to the desired preset value. The preset can be triggered via hardware or software. See manual for more detailed information.

Config Pin: The config pin is used for serial data communication. Via this interface an optional re-calibration and WIEGAND pulse testing of the kit encoder can be conducted after motor installation. A preset value can be applied as a software command. The protocol for communication is described in the manual. As alternative a graphical user interface with a Kit Control Box can be used for easy configuration and hardware setup, see website for more details. <https://www.posital.com/en/products/kit-encoders/kit-control-box.php>

13. Assembly Instructions

Step 1

Slip adapter plate over shaft and use screws, depending on tapped holes in motor frame, to secure. Slip centering tool over shaft to center adapter plate to the shaft centerline.

For a correct flange orientation, notice the two holes shown in the image. The connector location should be always assembled relative to these two holes.

Tighten mounting screws while pushing down on the centering tool and remove centering tool. Tighten screw to a typical torque of 0.4 Nm (Actual torque value may change due to machine screw selected and base mounting material)

Each Centering Tool is compatible with two shaft diameters and is identified by the number of dots machined into the side of the tool.

Step 2

Slide bottom shield/magnet assembly over shaft and lock alignment pins into adapter plate. Push down bottom shield all the way so it lies flat on the adapter plate.

The alignment pin geometry is not symmetrical as shown by the red circles. Take care not to damage the pins during installation onto the adapter plate.

Step 3

Slide gapping tool (Required thickness of 0.7mm [0.0275"]) between magnet and bottom shield. Push magnet down.

Step 4

Tighten both set screws with a 1.3mm [0.05"] hex key, using the channel hole in the adapter plate with a torque of 0.5 Nm.
