

Electric Cylinder Selection Guide

with AKD[®] Servo Drives and AKM[®] Servo Motors

KOLLMORGEN[®]

Because Motion Matters[™]

Kollmorgen: Your partner. In Motion.

Every solution comes from a real understanding of the challenges facing machine designers and users.

Innovators consistently rate Kollmorgen as one of their best motion systems

manufacturing partners. Whether you are looking for classic servo motors, direct-drive servo motors, stepper motors, drives & amplifiers, gearing, actuation, or CNC & multi-axis motion controllers, Kollmorgen is one of the few companies in the world who actually designs and manufactures all of these products.

Our customers are leaders in many industries such as Aerospace & Defense, Printing, Packaging & Converting, Food & Beverage Processing, Medical Imaging, In Vitro Diagnostics & Laboratory Automation, Pharmaceutical Manufacturing, Material Forming and Cutting, Oil & Gas, and Robotics. Kollmorgen is also a leader in Warehouse Automation, including complete AGV systems, software, awareness and autonomy.

Our Automation Solutions can be found on Mars and in space, ships and submarines, O&G drilling and metrology, surgical robots and laser eye surgery, even inside artificial hearts. These are just a few applications that demand high-performance and high-quality while satisfying their specific needs.

Because motion matters, it's our focus: Motion can distinctly differentiate a machine and deliver a marketplace advantage by increasing its performance and dramatically improving overall equipment effectiveness (OEE).

High-performance motion can make your customer's machine more reliable and energy-efficient, enhance accuracy and improve operator safety. Motion also represents endless possibilities for innovation.

We've always understood this potential, and thus have kept motion at our core and in our Vision, Mission & Values, relentlessly developing products that offer precise control of torque, velocity and position accuracy in machines that rely on complex motion.

Linear Actuation & Positioning Systems

Kollmorgen offers a comprehensive range of linear actuator products including electric cylinders, rodless actuators, and precision tables to meet a wide range of application requirements. For actuator products not included in this catalog go to www.kollmorgen.com for information about other Kollmorgen linear positioning products.

(Products highlighted are included in this catalog).

	Model	Product Family	General Information
	Electric Cylinders ¹	EC1 EC2 EC3 EC4 EC5 N2	<ul style="list-style-type: none"> • Highest Force (Thrust) • Clean, Hydraulic Replacement • Compact Cross Section • Extends into Work Area
	Rodless Actuators (screw drive)	R2A R3 R4	<ul style="list-style-type: none"> • High Force (Thrust) • High Repeatability • Long Travel • Load Carrying Capability
	Rodless Actuators (belt drive)	R2A R3 R4	<ul style="list-style-type: none"> • Very High Speed • Quiet Operation • Long Travel • Load Carrying Capability
	Precision Tables	DS4 DS6	<ul style="list-style-type: none"> • High Accuracy & Repeatability • Low Maintenance, Long Life • High Moment Loads

Electric Cylinders (EC)

Primarily designed to apply a force through an extendable rod, electric cylinders are a clean and efficient replacement for hydraulic actuators and pneumatic cylinders, and an alternative to many types of linear transmissions. A wide variety of mounting and coupling alternatives significantly increases their problem solving potential.

Rodless Actuators

Long travel, quiet operation, and high moment loading differentiates rodless actuators from other mechanical transmissions.

Precision Tables

Positioning tables are used when accurate and repeatable motion is critical (1 part per 10,000 or better). These tables offer a wide variety of single and multi-axis configurations, open and closed frame tables, ball or lead screw driven, and overhung and constant support for Kollmorgen geometry configurations.

Model	Max Speed ³ In/s (mm/s)	Max Thrust ^{2,3} Lb (N)	Repeatability ^{4,5} In (mm)	Max Payload Lb (kg)	Max Travel In (mm)
Electric Cylinders ¹	52.5 (1330)	5620 (25,000)	to 0.0005 (0.013)	Note 1	59.1 (1500)
Rodless Actuators (screw drive)	39 (1000)	700 (3110)	to 0.0005 (0.013)	300 (136)	108 (2743)
Rodless Actuators (belt drive)	118 (3000)	300 (1330)	to 0.004 (0.10)	300 (136)	108 (2743)
Precision Tables	32.5 (825)	440 (1960)	3 microns (commer- cial grade) / 1.3 microns (precision grade)	794 (360)	79 (2000)

Notes:

1. Electric cylinders are designed primarily for thrust application where loads are supported externally.
2. Thrust ratings are based on mechanical limits rather than motor limits unless indicated otherwise.
3. Max speed and max thrust ratings are not necessarily available simultaneously
4. Repeatability is dependent on feedback resolution, load, friction, and drive gain settings.
5. Repeatability is unidirectional unless otherwise specified

► Electric Cylinders

Kollmorgen Electric Cylinders offer a cost effective solution for linear positioning of supported or pivoting loads. They are descendants of hydraulic or pneumatic cylinders with many of the same design features but offer the benefit of providing a simpler and cleaner transmission.

When high thrust is required these rod type cylinders have the advantage over other linear components because the thrust is transmitted in-line. They also have the advantage of being isolated from the work area so can retract during other operations.

Flexibility in mounting allows either rigid or pivoting options depending on the requirement of the application. In addition to mounting options a wide variety of servo and stepper motor and drive products are offered as an integrated solution to provide the most cost effective combination of thrust, speed and positioning accuracy for your application.

Electric Cylinders Are Preferred When:

- Positioning an externally guided and supported load.
- Moving a load that pivots.
- There is a high concentration of airborne contaminants (rodless actuators are inherently less well protected).
- Replacing a hydraulic or pneumatic cylinder with an electro-mechanical solution.

Kollmorgen offers electric cylinder drive mechanisms designed around either lead screws or ballscrews. Ballscrews, being the more efficient of the two, utilize ballnuts riding on recirculating ball bearings resulting in higher speeds, loads and cycle rates. However, the more efficient design of ballscrew technology lends it to being backdriven when power is removed if precautions are not taken (e.g., electric brakes or counter loading).

Lead screws are capable of holding the load in position when power is removed, but are less efficient in operation.

Kollmorgen's guide system prevents rotation of the ball / lead nut, thus eliminating any torque loading to machine linkage

EC Servo Linear Actuators

- Designed for performance
- Highest quality precision rolled ballscrews and lead screws – for quiet, long-life operation
- Brushless Servo motor and Stepper motor options available
- Sealed for IP54 protection. IP65 option available.
- Thrust up to 25000 N [5620 lb]
- Speed up to 1.3 m/s [52.5 in/s]
- Metric design (ISO 6431)
- Available in 5 power ranges – EC1, 2, 3, 4 & 5

N2 Servo Linear Actuators

- Smallest Package Size
- Time-Proven Design
- Improved Durability Over Previous Designs
- Thrust up to 2670 N [600 lb]
- Speed up to 0.76 m/s [30 in/sec]
- English dimensions (to NFPA standards)
- Brushless Servo with encoder, resolver or SFD feedback
- Stepper motors also available

Typical Construction (EC2 cut-away shown)

Electric Cylinders

Features

Electric cylinders are direct descendants of hydraulic and pneumatic cylinders. Possessing many of the same unique design characteristics that made hydraulic and pneumatic cylinders popular, electric cylinders benefit from a cleaner and simpler power transmission. Decades of electric cylinder research and development has provided machine designers with a flexible, simple and unique approach to solving rigid or pivoting linear motion applications.

Electrically Powered, Maintenance Free

Today nearly all machines incorporate panel switches, sensors, lights, displays, PLCs or PCs. Electric power is nearly always available on the machine. Compressed air or hydraulic pumps are not always available or desirable. So why not simplify the machine by using the same control for all the axes of motion? A multi-axis programmable motor control can give you command of both rotary and linear motion. Lastly, the maintenance-free design provides another strong reason to consider electric cylinders in your next application.

Straight Line Force Path

Straight-Line Thrust Transmission Use all available Power

When high thrust is required, rod type cylinders have the advantage over other actuation means in that all the thrust transmitting components are in-line. This provides the simplest and most efficient means of transmitting thrust to the load.

Non-Intrusive: Thrust rod can clear out of the way.

A primary advantage of rod-type electric cylinders is the capability to extend into a work area during an operation and then retract to clear the area for subsequent operations. Another benefit of the rod-type design is that the motor and main body of the electric cylinder can be isolated from the work area. This is very useful when dealing with such hostile environments as vacuum, high temperature, or wash down applications.

Mounting examples...

Above: Rigid (side lug mounts)

Right: Pivot (clevis)

Mounting Flexibility

As in most aspects of design, a little creativity goes a long way when attaching a cylinder to a machine. Two general types of mounting styles are available, rigid and pivoting. Rigid mounting options include side-tapped holes, front and rear flanges, side lugs and side angle brackets. These typically restrict motion to straight-line travel paths. Pivoting mounts such as the clevis or trunnion allow the cylinder to move as a link in a dynamic assembly. There are many applications for this "arc-motion" – conveyor diverter gates, pivoting rollers, lid lifters for chemical chambers, "scissors clamps" and so on.

Specification Overview

Series	N2		EC1	EC2		EC3		EC4	EC5
Std. Maximum Stroke Length [in (mm)]	* 22.5 (571.5)		7.87 (200)	29.53 (750)		39.37 (1000)		59.06 (1500)	59.06 (1500)

Moisture/Contaminants	Humid, but Not Direct Contact		IP54 Std. IP65 Opt.						

*Note: Requires dual rod-end bearing option for length over 12"

EC3

Electric Cylinder Drive Comparison

The following chart will help pinpoint which linear drive mechanism is right for your application. Kollmorgen offers many positioner options, such as brakes, encoders, lubrication ports, preloaded nuts, and precision ground screws, that may help you meet your specification. If these standard options do not meet your requirements, please contact Kollmorgen for information regarding custom solutions.

Considerations	Lead Screw	Ball screw
Noise	Quiet	Noisy
Back Driving	Self locking	Easily backdrives
Backlash	Increases with wear	Constant throughout screw life
Repeatability	+/- 0.001	+/- 0.001
Duty Cycle	Moderate max. 60%	High max. 100%
Mechanical Efficiency	Low Bronze Nut - 40%	High 90%
Life and Mechanical Wear	Shorter life due to high friction	Longer
Shock Loads	Higher	Lower
Smoothness	Smooth operation at lower speeds	Smooth operation at all speeds
Speed	Low	High
Cost	\$\$\$ Moderate	\$\$\$ Moderate

Comments

Lead Screw: Sliding nut design provides quiet operation.

Ball screw: Transmits audible noise as balls recirculate through nut during motion.

Lead Screw: Good for vertical applications.

Ball screw: May require brake or holding device when no holding torque is applied to the screw.

Lead Screw: Considered worn-out when backlash exceeds 0.020". Typically 0.006" when shipped from factory.

Ball screw: Typically constant at 0.006" (screw/nut only).

Lead Screw: Low duty cycle due to high friction from sliding surface design.

Ball screw: High screw efficiency and low friction allow high duty cycle.

Lead Screw: Low efficiency sliding friction surfaces.

Ball screw: High efficiency smooth rolling contact.

Lead Screw: Mechanical wear is function of duty cycle, load and speed.

Ball screw: Virtually no mechanical wear when operated within rated load specifications.

Lead Screw: Better suited because of larger surface area.

Ball screw: Brinelling of steel balls limits shock load capability.

Lead Screw: At extreme low speeds, units have a tendency to stop/start stutter (due to friction).

Ball screw: Generally smoother than lead screw types through the entire speed range.

Lead Screw: Extreme speeds and accelerations can generate excessive heat and deform the screw.

Ball screw: Can achieve higher speeds than the lead screw due to the efficiency of the ballnut vs. the sliding contact of the solid nut. Speeds in excess of ratings can deform screw.

Electric Cylinder Servo Systems

N2 & EC Series Electric Cylinder Servo Systems

N2 with AKM23

EC2 with AKM23

Kollmorgen's

Electric Cylinder Servo Systems provide an unprecedented level of flexibility.

Helping you build a better machine, faster.

- ➔ The N2 and EC Series Electric Cylinders offer an unprecedented degree of flexibility. This flexibility enables solution to be optimized for the application requirements reducing system cost and minimizing the electric cylinder size.
- ➔ The flexible design of the N2 and EC Series simplifies engineering design and system integration by providing an integrated gearing design of both timing belt and helical gearing.
- ➔ Integrated AKM brushless servo motor provides a system solution reducing application and engineering requirements as well as eliminates mechanical interface and interoperability issues.

Standard Configurable Electric Cylinder Designs:

	N2 Series	EC Series
Transport Screw	Precision ballscrew (2 and 5 [rev/in] pitch) Lead screw (5 and 8 [rev/in] pitch)	Precision ballscrew (3 to 32 [mm/rev] lead) Lead screw (4 [mm/rev] lead)
Integrated Gearing	Timing belt (1.0, 1.5, 2.0:1 ratios) Helical gear (2.5, 3.5, 12.0:1 ratios) Inline (direct coupled)	Timing belt (1.0, 1.5, 2.0:1 ratios) Helical gear (2.0, 2.5, 4.0, 5.0, 7.0, 10.0:1 ratios, model dependent) Inline (direct coupled)
Mounting Types	7 Parallel Mounts 5 Inline Mounts	8 Parallel Mounts 5 Inline Mounts
Rod-End Adapters	4 Types (English and Metric)	5 Types (English and Metric)
Stroke Lengths	Standard stroke (2 to 22.5 in) Custom stroke lengths available	Standard stroke lengths EC1 50 to 200 mm (7.87 in) EC2 50 to 750 mm (29.5 in) EC3 50 to 1000 mm (39.4 in) EC4 & EC5 50 to 1500 mm (59.1 in)

Options and Accessories

Electric Cylinder accessories and time-proven options have been designed for the industrial environment to simplify system integration. Options include limit switches, dual rod-end bearings, guide bearing, protective boot, and extended temperature ranges just to name a few. See the option and accessory section on pages 97-105 for more details.

N2 & EC Series Electric Cylinder Servo Systems

The Electric Cylinders Servo Systems are offered with the Advanced Kollmorgen Drive (AKD) series to provide the optimum combination of performance and price. Let your application and system requirements determine what solution integrates the best.

- Single vendor solution for the complete electro-mechanical system ensures system interoperability and a single dedicated Worldwide Motion-control supplier for support.
- The Electric Cylinder Servo Systems are available in drive and control technologies ranging from simple and intuitive positioning drives to fully programmable IEC 61131 based control systems:
- The Electric Cylinder Servo Systems leverage Kollmorgen's AKD diverse option configurations and AKM brushless servo motors for complete system flexibility and industry leading servo response and precision.

Flexible Drive Universal Control Options & Power Range	AKD 120 / 240 / 480 Vac

Quick Selection Guide Reference

Systems listed in charts represent the most economical package to meet the criterion.

- 1) Select chart for application speed range
Low Speed - Speeds up to rated linear speed of 12 in/sec
- 2) Select system by required continuous thrust (lbs) and required rated speed (in/sec).

Other applications considerations (system resolution, inertia ratio, desired safety margins, etc) may result in selection of a different system.

For additional AKD system specifications see page 121.

For detailed force speed system curves for AKD, see pages 36-81.

Performance data represents continuous thrust (lb) at rated speed (in/s).

Based on AKD amplifier with 240 Vac, 3 phase supply.

Electric Cylinder / AKM Servo Motor Combinations

Continuous Thrust (lb)

Ratings are based on the AKM servo motor and the corresponding AKD Drive.
See pages 110-115 for details on Drive & Motor System combinations.
Specifications are based on 230 Vac, 3 phase voltage supply.
Force Speed Curves located on pages 36-81.

Plotted value is continuous thrust (lb), refer to chart for the associated rated speed value.

Electric Cylinder Stepper Systems

The Electric Cylinder Stepper Systems are offered with a versatile stepper drive and multiple hybrid stepper motor sizes to provide system flexibility. Let your application and system requirements determine what solution integrates best.

- Single vendor solution for the complete electro-mechanical system ensures system interoperability and single dedicated worldwide motion-control supplier for support.
- The Rodless Actuator Stepper Systems are available with standard step and direction drive functions, and enhanced drive technologies incorporating simple program control functionality (P7000 with -PL option).
- The Rodless Actuator Stepper Systems leverage multiple stepper motor sizes to provide the most cost effective solution to meet your machine's performance requirement.

Advanced Stepper Motor Control Easy Commissioning Compatible with a Wide Range of Motors	P70630 120/240 VAC
	<ul style="list-style-type: none"> • Base Unit: accepts step and direction inputs
	<ul style="list-style-type: none"> • An integrated position controller is available (-PN option) • Up to 68 absolute or incremental moves • Specify detailed move parameters or simply distance and time
	<ul style="list-style-type: none"> • Multisteping™ inserts fine micro-steps to smooth coarse low speed motion
	<ul style="list-style-type: none"> • Advanced auto-tuning provides outstanding low-speed performance

P7000 Stepper Drive Controller

P7000 stepper drives offer a unique level of system functionality, smoothness, high-speed performance and innovation unmatched in the industry.

The compact P7000 is designed to power Kollmorgen step motors ranging from NEMA size 17 up to NEMA size 42. Two power configurations are available for operation directly from AC power, or from a DC power supply.

There are two levels of control offered. The basic drive accepts step and direction inputs. P7000 drives are also available with an integrated position controller (-PN option). The drives are configured by either on-board dip switches, or with the P7000 tools software.

Advanced P7000 Features Make it the Best Choice to Meet Your Application Requirements

Multistep™

Also known as auto-smoothing. The P7000 drive accepts full step pulse commands from the indexer and inserts fine micro-steps to smooth coarse low speed motion. This allows you to significantly upgrade machine performance without having to redesign machine control architecture.

Auto-Tuning

Advanced current auto-tuning techniques provide outstanding low-speed smoothness. The P7000 senses the motor's characteristics and automatically fine tunes itself to meet your high-performance needs. This reduces installation and set-up time.

Mid-Band Anti-Resonance Control

Reduces negative effects of mechanical resonance, allowing you to get more out of a smaller motor and virtually eliminating nuisance stalls and machine downtime.

Idle Current Reduction

If you do not require the motor's full torque to hold a load at rest, you can select the right amount of current (torque) to reduce motor heating and power consumption. This increases the life of the system.

Dynamic Smoothing

Quasi-S-curve algorithm reduces jerk, especially upon acceleration. Increases mechanical life of the machine and reduces energy consumption.

Intelligent Indexing Option (-PN)

Wizard-like P7000 helps you to develop and link motion tasks such as homing and conditional and unconditional indexing. You can be up-and-running quickly.

Modbus RTU Compatible

The intelligent indexing option (-PN) supports Modbus RTU to control motion with an external interface device. External interfaces make controlling motion simple for machine operators.

P7000 Tools

The position node option allows you to configure up to 63 absolute or relative moves. You can specify the moves' distance, acceleration, velocity, and deceleration rates, or simply specify the distance and total time for the move – P7000 will perform the calculations automatically.

Specifications	Units	P70530	P70360
Input voltage range	Volts	20 - 75 Vdc	120 or 240 Vac
Continuous current	Amps rms	5	2.5
Microstep peak current	Amps peak	7.1	3.5

Note: For complete P-series model nomenclature, refer to page 166.

Electric Cylinder Quick Selection Guide

Quick Selection Guide Reference

Systems listed in charts represent the most economical package to meet the criterion.

- 1) Select chart for application speed range
Low Speed - Speeds up to rated linear speed of 12 in/sec
- 2) Select system by required continuous thrust (lbs) and required rated speed (in/sec).

Other applications considerations (system resolution, inertia ratio, desired safety margins, etc) may result in selection of a different system.

For additional P7000 system specifications see page 19.

For detailed force speed system curves for P7000, see pages 36-81.

Performance data represents continuous thrust (lb) at rated speed (in/s).

Based on P7000 drive with 120 or 240 Vac single phase supply.

Electric Cylinder / Stepper Motor Combinations

High Speed Stepper Options (12 in/s or greater)

		Speed (in/sec) - High Speed														
		16	20	24	30	36	42	50

Quick Selection Guide Reference

Systems listed in charts represent the most economical package to meet the criterion.

- 1) Select chart for application speed range
High Speed - Speeds greater than 12 in/sec
- 2) Select system by required continuous thrust (lbs) and required rated speed (in/sec).

Other applications considerations (system resolution, inertia ratio, desired safety margins, etc) may result in selection of a different system.

For additional P7000 system specifications see page 19.

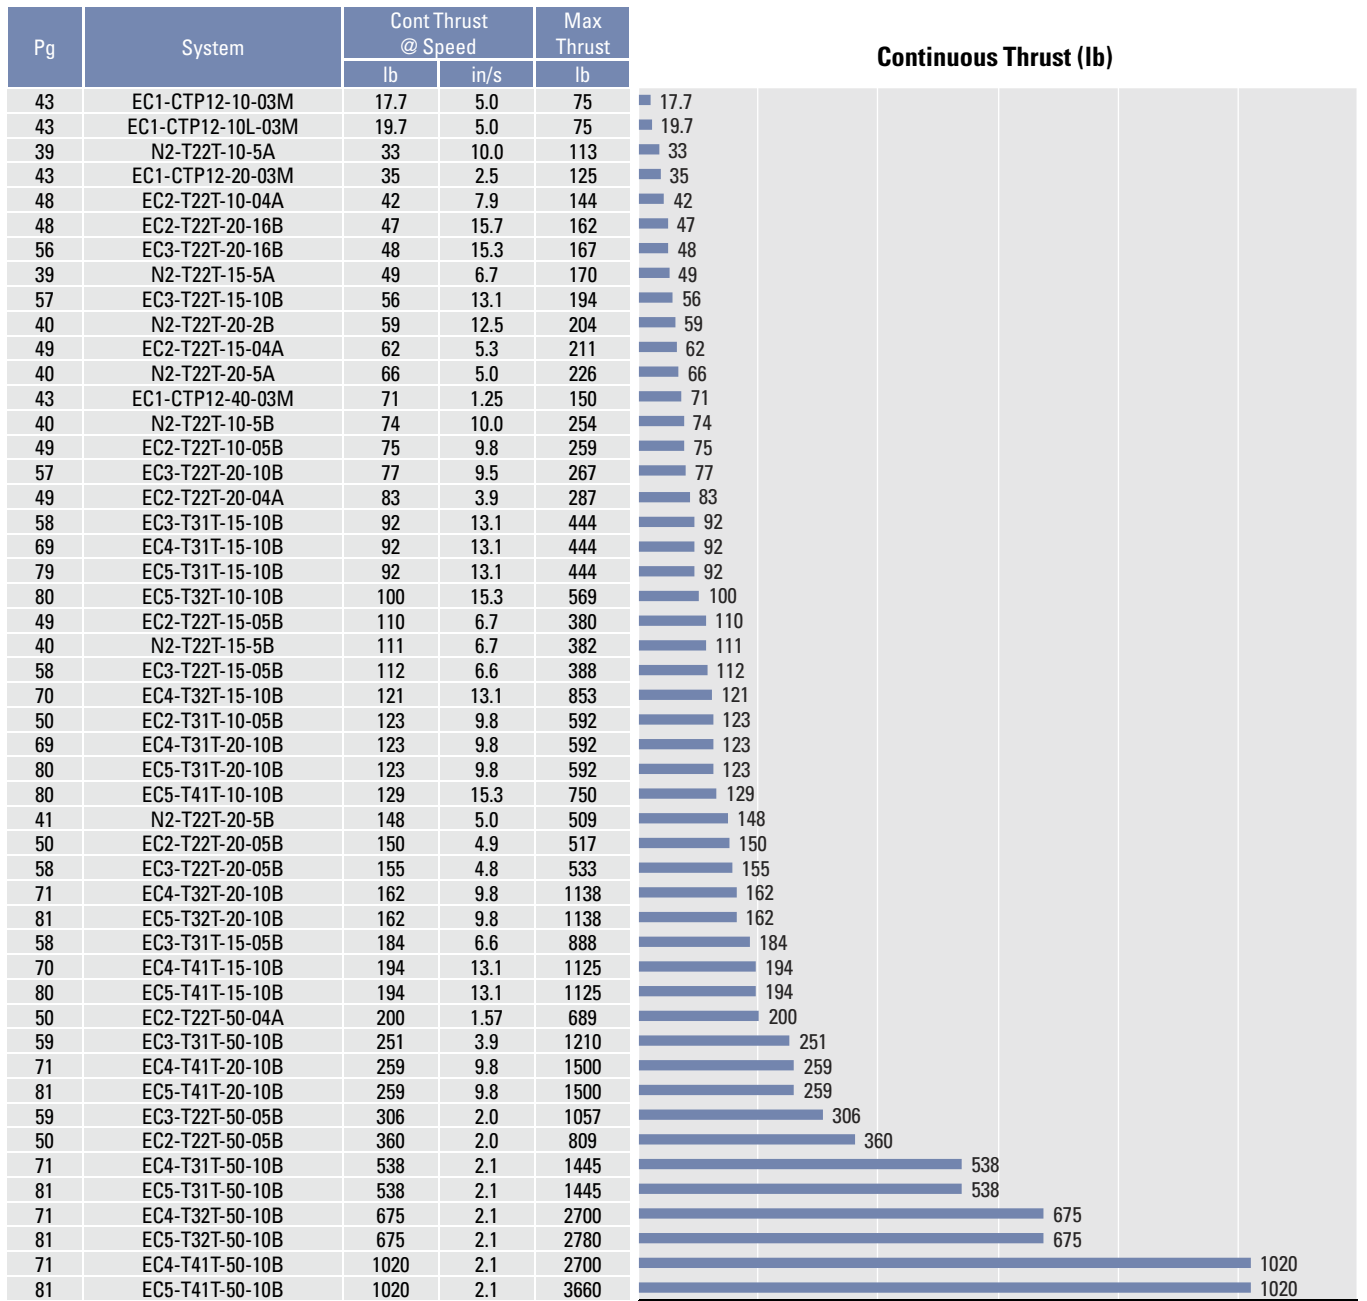

For detailed force speed system curves for P7000, see pages 36-81.

Performance data represents continuous thrust (lb) at rated speed (in/s).

Based on P7000 drive with 120 or 240 Vac single phase supply.

Stepper Motor Performance Summary

Low Speed Stepper Performance

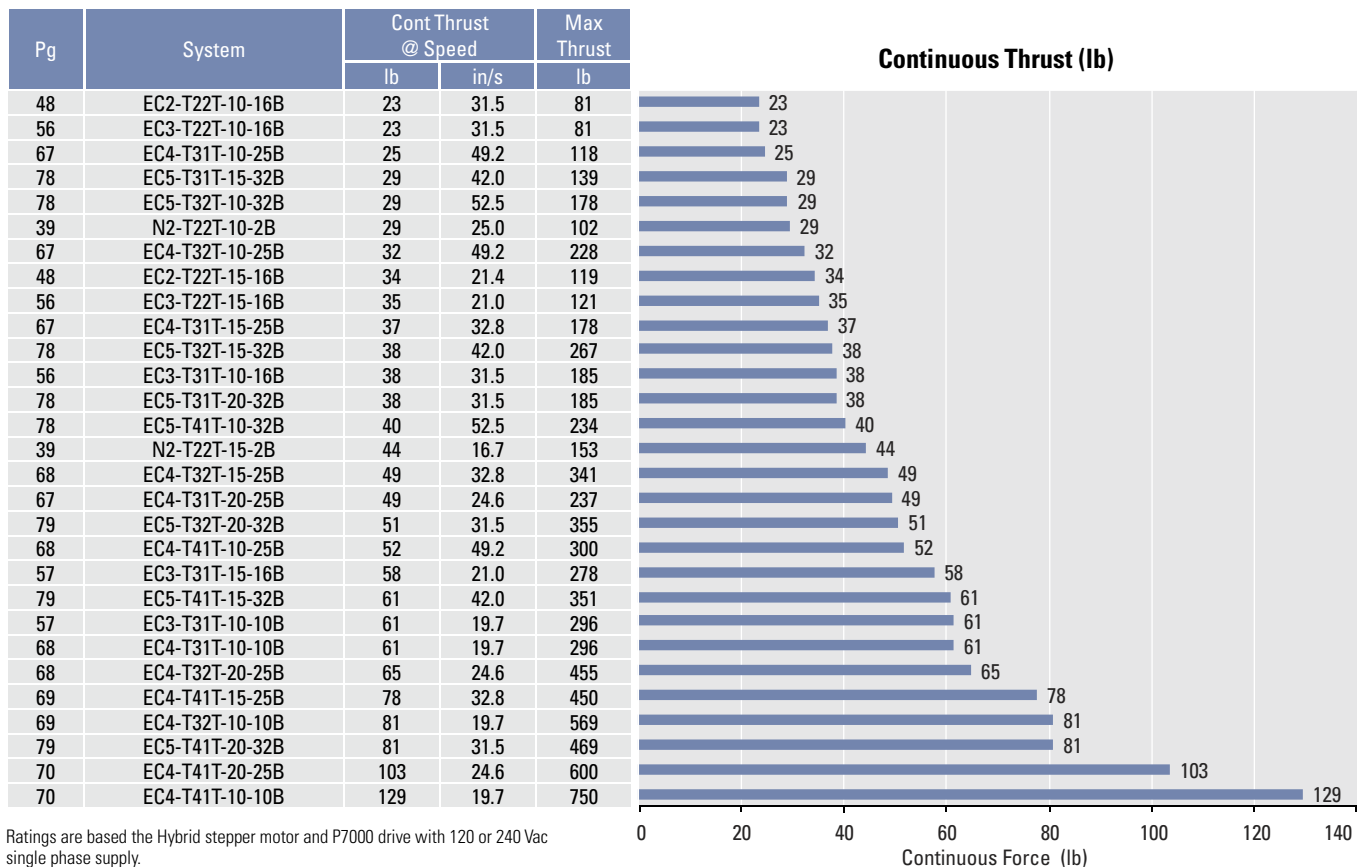

Ratings are based on the Hybrid stepper motor and P7000 drive with 120 or 240 Vac single phase supply.

See pages 110-115 for details on Drive & Motor System combinations.

Force Speed Curves located on pages 36-81.

High Speed Stepper Performance

Ratings are based the Hybrid stepper motor and P7000 drive with 120 or 240 Vac single phase supply.

See pages 110-115 for details on Drive & Motor System combinations.

Force Speed Curves located on pages 36-81.

Plotted value is continuous thrust (lb), refer to chart for the associated rated speed value.

N2 Series Electric Cylinder Specifications

General Specifications

Travel Lengths

Cylinder	Stroke Designator/Effective Travel Lengths						
Stroke length designator [in]	2.0	4.0	6.0	8.0	12.0	*18.0	*24.0
Effective Travel Length [in]	2.0	4.0	6.0	8.0	12.0	16.5	22.5

* Dual rod-end bearing required for 18 inch and 24 inch stroke units.

* Effective travel reduced by 1.5 inches respectively with dual rod-end bearing.
Custom travel lengths are available.

Construction Materials

Bearing Housings:	Type 380 die cast aluminum, epoxy coated
Cylinder Housing:	6063-T6 aluminum, hard-coated anodized and Teflon® coated
Thrust Tube:	304 Series Stainless Steel, 1/4 hard, ground and polished
Wiper seal:	Polyurethane

Speed Reducer Versions

Belt/Pulley:	AT-5, polyurethane with steel tensile cords
Helical Gearing:	Alloy steel, case hardened
Support Bearings:	Ball bearings

Transport Screw Versions

Ballscrew:	Carbon steel screw
Ballnut:	Alloy steel, heat-treated ballnut
Lead screw:	Carbon steel screw
Lead nut:	Bronze lead nut (standard, recommended for servo system) (Lubricated polyacetal plastic drive nut also available but not recommended for use with servomotor based systems.)

System Specifications

Electric Cylinder	Screw-Nut Type	Pitch [revs/in]	Screw Diameter [in]	Efficiency [%]	Minimum Backdrive Load [lb]	Maximum Thrust [lb]	Maximum Speed [in/s]	Backlash [mm (in)]	Repeatability [mm/300mm (in/ft)]

To convert inertia units from oz-in² to oz-in-sec² divide by 386.

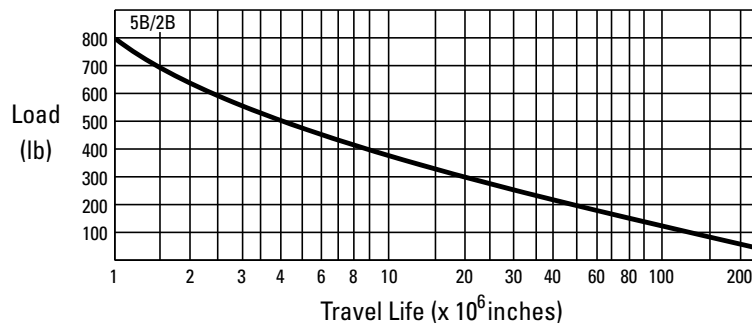

N2 Series Electric Cylinder Specifications

General Specifications

Ballscrew Life

Ballscrew life is rated in inches of travel at a given load. The values in the chart below indicates the travel life where 90% of all units in a sample will continue to work, while 10% have failed. This is similar to the B10 rating of a roller bearing mechanism. Be sure to consider acceleration loads as well as thrust, gravity and friction loads.

Ballscrew Life: Load vs. Travel Life Chart

Environmental Operation (see page 146 for additional information)

Temperature 32° to 140°F, [0° to 60°C]
 H – High temperature option allows 32° to 160°F, [0° to 70°C]
 F – Sub-freezing temperature option allows -20° to 105°F, [-29° to 40°C]

Moisture Humid, but not direct moisture contact
 W – Water resistant option allows some direct moisture contact

Contaminants Non-corrosive, non-abrasive.
 PB – Protective Boot option prevents moisture and dry contaminants from entering the cylinder through the wiper ring on the rod

EC2 and EC3 with AKM23

Environmental Operation (see page 146 for additional information)

Temperature

-30° to 70°C [-22° to 158°F]

When operating below 2°C [35°F] vent tubing fitting must be installed.

Consult the factory for more information.

Moisture/Contaminants

IP 54 rated: Polyurethane thrust tube wiper seal.

Mating surfaces gasket sealed. Protected against dust and splashing water (non-corrosive, non-abrasive).

Limited ingress permitted.

Vent Tube Fitting: A vent tube fitting is included, which can be installed to permit the Actuator to breathe from a non-contaminated area, or receive a positive pressure continuous purge (14-20 kPa [2-3 psi]).

PB Protective Boot (IP65) Option: An optional thrust tube boot prevents moisture and dry contaminants from bypassing the thrust tube wiper seal, providing IP65 protection when used with included vent tube fitting. The boot also prevents contaminant buildup on the thrust tube.

Clean Room & Vacuum Applications: Kollmorgen has designed special actuators for clean room and vacuum applications. Please consult the factory if your application requires special environmental compatibility.

Maintenance

The EC Series Actuator design eliminates the need for most routine maintenance. Re-lubrication is required in high cycle applications.

Lube Port

EC2 - EC5 models include a lube port and adapter for a standard grease gun.

EC4 with AKM42

EC Series Electric Cylinder Specifications

Thrust Tube Torque Capacity

Thrust tube does not rotate during operation.

Maximum allowable torque during operation and installation is shown in the following table:

	Torque Capacity [lb-in (Nm)]
EC1	18 (2.0)
EC2	45 (5.0)
EC3	67 (7.5)
EC4	90 (10)
EC5	90 (10)

Thrust Tube Side Load Capacity vs. Extension

Life

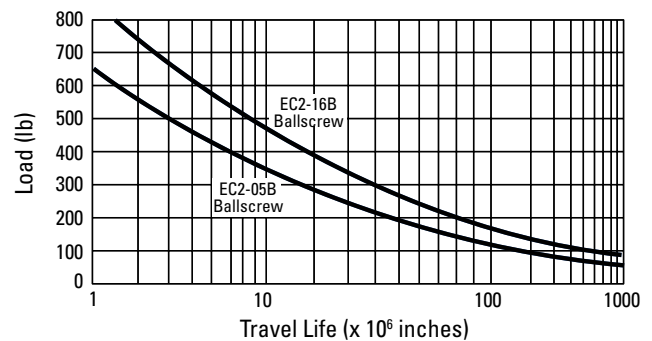

Ballscrew

Ballscrew life is rated in inches of travel at a given load. The values in the chart indicate the travel life where 90% of all units in a sample will continue to work, while 10% have failed. This is similar to the B10 rating of a roller bearing mechanism. Be sure to consider acceleration loads as well as thrust, gravity and friction loads.

EC1 Ballscrew Life

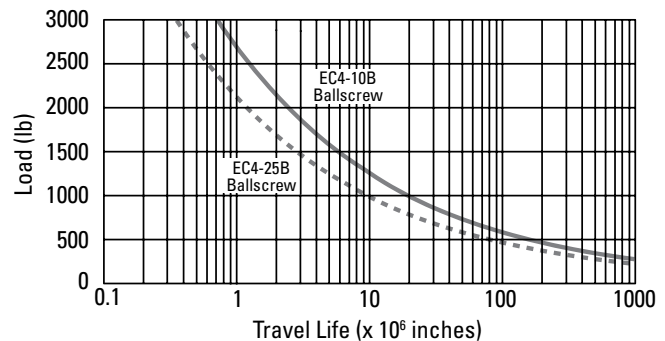

EC2 Ballscrew Life

EC3 Ballscrew Life

EC4 Ballscrew Life

EC5 Ballscrew Life

Lead Screw

Usable life for a lead screw is defined as the length of travel completed before backlash (of lead screw/nut) exceeds 0.020" [0.5 mm]. A travel life of 25 km [1 million inches] under the maximum rated load can be used as a general approximation. However, since directly dependent on application conditions (load, duty cycle, move profiles, and environment), it is difficult to predict a statistical travel life.

Electric Cylinder Options

Brake Option

The BS and motor brake options are typically used with electric cylinders employing ball screw drive assemblies. The electrically released, spring set brake prevents backdriving when the unit is at rest, or in case of a power failure.

When power is applied, the brake releases and the cylinder is free to move. When power is off, springs engage the brake to hold the load in position.

The BS brake is mounted directly to the ballscrew to provide holding torque, without relying on the rest of the drive train.

When using a motor mounted brake the brake torque is multiplied by the belt or gear reduction, and does not interfere with certain rear mounting options. But, if the belt fails, the brake will be inoperative.

BS is not available with:

- Inline motor orientation
- Rear mounting options: -MP2, -MP3, -MS1, -MF2, -MF3
- EC1 (Use BA24 option)

BS115 Wiring Connections

BS Option

Series	Dim "A" in [mm]	Dim "B" in [mm]

EC5	-32B Ball	7770 [1750]	—
	-10B Ball	24800 [5590]	—

Notes:

- High vibration in a machine may cause a lead screw to backdrive at lower values than indicated above. In such applications, a brake may be necessary.
- The BS and motor brakes should only be used to hold static (already stopped) loads. They are not designed for repeated use as dynamic brakes.
- Quick-disconnect cable provided only on EC models. N2 includes flying leads cable from grommet on brake can.

BA Brake Options:

Motor Brake AKM

BA24 for EC1

Mounting Location:	Rear motor shaft	Inline with motor shaft within gear housing
Voltage Options:	24 Vdc	24 Vdc
Cable Type/Length:	Part of motor cable set	Flying Leads
Holding Torque:	See holding torque table	0.56 Nm (5.0 lb-in)

	Holding Torque Nm (lb-in)
AKM23	1.42 (12.6)
AKM42	5.30 (46.9)
AKM52	14.50 (128)

Example for BS or BA24 Options

$$\text{Holding Force (N)} = \frac{\text{Brake (Nm)} \times 2\pi \times 1000 \times \text{gear ratio}}{\text{Lead (mm/rev)}}$$

Example: EC3-AKM42G- ■■■-15-16B

$$\text{Holding Force} = \frac{5.3 \times 2\pi \times 1000 \times 1.5}{16} = 3120 \text{ N}$$

BA24 Option

Electric Cylinder Options

N2 Dual Rod-End Bearing Option

DB Dual Rod-End Bearing

Our standard N2 Series electric cylinder contains a single rod-end bearing. The dual rod-end bearing (DB) option increases thrust tube side load capacity and reduces undesirable thrust tube runout, while reducing the stroke by 1.5 inches. (All EC Series cylinders are equipped with a dual rod-end bearing automatically, so this option does not apply to them.)

DB available with:

- N2 Series 12 inch stroke and below

DB required with:

- N2 Series above 12 inch stroke

Notes:

- The DB option reduces stroke by 1.5 inches (e.g. 18" with DB yields only 16.5" actual stroke.)

Side Load

All Kollmorgen electric cylinders are designed to withstand a limited amount of side load on the thrust tube. The thrust tube in a standard N2 Series cylinder is supported by a single rod-end bearing and by a patented internal guide assembly. This bearing system has a limited capacity to handle side loads, shown in the curve below.

When increased side load capacity or stiffness is required, or when moving a load that is not externally supported, the dual rod-end bearing (DB) option is recommended. This option adds a second thrust tube rod-end bearing for additional support, while subtracting 1.5 inches from the available stroke. N2 models above 12 inches stroke require the DB option.

Another means of increasing side load capacity is to use the higher capacity EC series, which includes the dual rod-end bearing in its standard configuration.

N2 Series — Side Load Capacity vs. Extended Length

Standard N2 Cylinder (Single Bearing)

DB Option (Dual Bearings)

Runout

The -DB option reduces thrust tube runout by lengthening the thrust tube support bearing in the rod-end housing.

Kollmorgen recommends the DB option to reduce runout whenever the thrust tube is the only means of guiding the load. Performance improvement is most observable for cylinders with stroke length above 12 inches, or whenever runout is critical as the thrust tube approaches full extension.

For the least amount of runout possible for a standard product, specify the DB option and also increase the stroke of the cylinder while "short-stroking" the unit.

If the load is guided externally by linear bearings, the standard bearing is preferred since it allows greater mounting misalignment and minimal friction.

Selection Criteria

DB Option	Standard
When using clevis or trunnion mount	When rigidly mounted
>12 in	<12 in
Unguided thrust tube	Guided thrust tube (externally)
High side load	
Low runout critical	

Linear Potentiometer Option

L Linear Potentiometer Option

The L linear potentiometer option is required for operation with our Analog Position Controls, and is used in applications where analog position feedback voltage signal is needed.

The linear potentiometer resides within the cylinder housing and is energized by an external DC voltage source. The potentiometer wiper arm is attached to the drive nut/guide flange assembly, and moves the same distance as the thrust tube. The signal from the linear potentiometer is an absolute voltage, proportional to linear displacement of the cylinder.

L available with:

- EC and NC cylinders

Connections

Dimensions in [mm]

Cylinder Model	Dim. A [in (mm)]	Dim. B [in (mm)]
N2	1.38 (35.1)	1.01 (25.7)

	23.6 (600)	7000	

Electric Cylinder Options

Linear Rod Bearing Option

LR Linear Rod Bearing Option

The LR linear rod bearing option is used in applications where side loads are present, or when the load is not externally supported.

Reasons for using the LR Linear Rod

Bearing are:

- Increased side load capacity
- Anti-rotation—reduces any rotational motion of the moving load
- Higher positioning efficiency when side loads are present
- Lower thrust tube runout

LR available with:

- EC2

LR not available with:

- MF1, MF3, MS1, MS2 mounting options

Weight calculation:

$$\text{Weight (lb}_f\text{)} = 0.0147 \text{ stroke (mm)} + 7.6 \text{ lb}_f$$

Dimensions in [mm]

To order the Linear Rod Bearing as a separate component:
Linear Rod Bearing Part Number

Example: LR-EC2-0200-A

LR	—	EC2	—	0200	—	A
LR		EC2		Stroke in mm		Revision

Protective Boot Option

PB Protective Boot Option

With the PB option, a durable polyurethane boot protects the thrust tube area from solid contaminants (dust, wood and metal shavings), and splashed liquids, etc.

EC Series cylinders equipped with the PB are protected to the IP65 standard. Note that some Kollmorgen motor options are not protected to this level.

Consult the factory for assistance when special environmental protection is required.

We also have special options for clean room applications, where outgassing and contamination by the cylinder are a concern.

PB available with:

- All EC and N2 Electric Cylinders

Dimensions in [mm]

When fully retracted, the boot gathers on an extra length of thrust tube. The extra thrust tube length is tabulated here.

Cylinder Model		Dimensions	
Series	Stroke Length	Dim. L Add'l Length in [mm]	Boot Diameter in [mm]
EC2	0-149 mm	1.16 [29.5]	2.50 [63.5]
	150-299	1.83 [46.5]	
	300-449	2.54 [64.5]	
	450-600	3.21 [81.5]

	15.20-16.50	2.80 [71.1]	

Electric Cylinder Options

N2 Environmental Options

Temperature Ranges (N2 Series)

	Operating	Storage
Standard N2	32° to 140°	-40° to 185°
[F (C)]	(0° to 60°)	(-40° to 85°)
F Freezing	-20° to 105°	-40° to 185°
[F (C)]	(-29° to 41°)	(-40° to 85°)
H High Temp	32° to 160°	-40° to 185°
[F (C)]	(0° to 70°)	(-40° to 85°)

Note: F and H can not be ordered on the same cylinder.

H High Temperature

The H high temperature option allows operation in high temperature environments (to 160°F [70°C]) by changing certain plastic parts within the cylinder to bronze.

H available with:

- All N2 Series

Notes:

- Consideration must be given to the operating temperature ranges of the motor, encoder, and limit switches.

F Sub-Freezing Environment Option

In extremely cold conditions the lubricating grease in the positioner thickens, rubber parts (belts and stops) stiffen, and mechanical clearances tighten. This option includes two alterations:

1. Bearing grease is replaced with a less viscous lubricant.
2. Lead nut tolerances are increased. Both thread clearance and pitch length are increased to allow for the varying coefficients of expansion between the steel leadscrew and polyacetal or bronze drive nut.

The result is a device which can operate at these low temperatures, but with reduced life (due to the pre-worn lead nut surfaces).

Contact Kollmorgen for more details. No change is necessary in ball nut models since there is steel to steel contact (same coefficient of thermal expansion).

F Sub-Freezing Environment Option available with :

- All N2 Series

Notes:

- This option increases system backlash to 0.025 inches (0.64 mm) max. for lead screw units.
- Should a -F sub-freezing option lead screw unit be operated at room temperature or above, noisy operation and increased backlash are normal.

W Water Resistant Option

The water resistant option (W) is recommended in applications where the cylinder is exposed to light mist or occasional splashing with water or non-corrosive liquids. In addition to a sealant on all mating surfaces, a 10 foot (3 m) breather tube and fitting is provided to allow the unit to breathe from a non-contaminated dry area. Or, the customer may choose to apply positive, low pressure (2-3 psi [14-20 kPa]) dry air to the cylinder through this fitting.

W available with:

- All N2 Series

Notes:

- The -W option does not provide a waterproof cylinder. The cylinder cannot be submerged or immersed repeatedly in water.

W Breather Dimensions N2 Series Cylinders

Electric Cylinder Accessories

Accessories

Magnetic Position Sensors

Kollmorgen Electric Cylinders are equipped with position indicating magnets installed internally on both sides of the guide cylinder. Non-contacting position sensors are available to sense the magnet as it passes by.

Position sensors mount directly to standard EC and N2 Series cylinders. NPN or PNP sensors are available in normally open or normally closed switch configurations. These sensors use a Hall-effect element and simple solid state electrical circuit. See page 114 for product specifications.

End-of-Travel Limits

To maximize cylinder life, Kollmorgen recommends the use of end-of-travel "limit switches" (position sensors) with all cylinders.

The purpose of an end-of-travel sensor is to signal the controller that the cylinder is about to travel beyond its normal safe operating region, and is nearing its physical end of stroke. The controller brings the cylinder to a stop to prevent physical contact, and to avoid damage to the cylinder, the load, or the machine. The sensors must be located such that an adequate stopping distance is provided between the sensing position and the physical end of stroke. Normally closed switches are generally used for end-of-travel sensing. Normally closed switches are considered "fail safe" because when a cable becomes accidentally severed or disconnected, motion is prevented.

Position Sensing

Programmable position controls use position sensors for two purposes. A normally open switch is generally used to establish a home, or zero reference position. Normally closed switches are used for extend and retract end-of-travel limits.

	Storage Temperature	14° to 158°F [-10° to 70°C]		-4° to 176°F [-20° to 80°C]	
	Protection Rating	IP67			
	 Approved	Yes			

Hall-Effect Switches

- Higher tolerance to vibration
- Greater durability and reliability (no moving parts)
- Requires external DC power. Available on Kollmorgen controls.

Wiring for EC1-18P-03, EC1-18P-NC-03, PSP-1 and PSP-2

Notes:

1. Normally closed PNP sensors are recommended to provide fail-safe operation
2. NPN Hall effect sensors are also compatible with Kollmorgen drive however require a pull-up resistor.

Position Sensors

Position Sensor Mounting

The diagrams below show sensor mounting location when cylinder magnet and sensor are physically aligned.

This location is recommended as a starting point when setting up a cylinder for the first time. Depending on the speed and payload of the application, switches may need to be moved inward to prevent hard-stop crash when the load travels at full speed past a limit switch.

Notes:

- Position sensors can be mounted along either side of a cylinder.
- Recommended minimum distance between switches is 0.65 inches.
- Using position sensors for end-of-travel protection reduces effective travel distance. Consult factory for details.

▶ AKM[®] Servo Motor

Kollmorgen's AKM family of servo motors gives you unprecedented choice and flexibility from a wide range of standard products so you can select the best servo motor for your application. By pairing AKM servo motors with our family of plug-and-play AKD[®] servo drives, selecting the right motion control products has never been easier. Pick from thousands of servo motor/servo drive combinations outlined in this selection guide or go to our website to find the best solution for your application.

Standard AKM servo motors and AKD servo drives offer the best of both worlds – the exact specifications of a custom solution with the faster delivery times and lower cost of a standard catalog product. For your truly unique motion control applications, work with our engineering team to customize a solution for your machine design. Either way, standard product or customized, we can help you choose the motion control solution that meets your exact requirements.

The Benefits of AKM® Servo Motor

- | | |
|---|---|
| <ul style="list-style-type: none"> • Best-in-Class Performance | <ul style="list-style-type: none"> • Industry-leading motor power density • Same size AKM/AKD system delivers up to 47% more shaft power • Compensation for stiff and compliant transmissions and couplings • Exceptionally low cogging |
| <ul style="list-style-type: none"> • Flexibility to Find an Exact-fit Solution in a Standard Product | <ul style="list-style-type: none"> • AKM offers 28 frame-stack combinations and 120 standard windings in a single motor line • 4.8 million possible AKM part number combinations and growing • Simplifies or eliminates mechanical modifications and engineering adaptation • Available with single cable technology with digital feedback (Digital Resolver SFD3 or HIPERFACE® DSL) • Washdown and Food Grade options for AKM • Higher torque models up to 180 Nm of continuous torque |
| <ul style="list-style-type: none"> • Ease-of-Use and Faster Commissioning | <ul style="list-style-type: none"> • Plug-and-play motor recognition drive commissioning • Reduce cycle time and sensor-and-wiring costs by eliminating traditional homing methods • Reduction in set-up time for each servo system |

AKM[®] Servo Motor Series

AKM Motors Offer Extremely High Torque Density and High Acceleration

The AKM high-performance motor series offers a wide range of mounting, connectivity, feedback and other options. These motors offer superb flexibility to meet application needs with:

- 8 frame sizes (40 to 260 mm)
- 28 frame-stack length combinations
- More than 120 standard windings

Features

Torque

0.16 to 180 Nm continuous stall torque (1.4 to 1590 lb-in) in 28 frame/stack combinations. Specific torques are often available from multiple frame sizes to optimize mounting and inertia matching capabilities.

Speed

Speeds up to 8000 rpm meet high speed application requirements. Windings tailored to lower speeds are also available.

Voltage

AKM motors can be applied to all standard global voltages. Windings are specifically tailored to work with drives powered by 75 Vdc, 120, 240, 400 or 480 Vac.

Mounting

Multiple mounting standards are available to meet common European, North American, and Japanese standards.

Feedback

AKM motors include resolver, encoder (commutating), Sine-Absolute encoder or SFD (Smart Feedback Device) feedback options to meet specific application requirements.

Smoothness

Smooth performance results from low-cog, low-harmonic distortion magnetic designs.

Connectivity

Rotatable IP65 connectors, straight IP67 connectors or low cost IP20 Molex plugs are both available to provide flexibility. Single connectors/plugs (combined power and feedback) are also available to minimize motor and cable cost (SFD and DSL only).

Thermal

Windings are rated conservatively at 100°C rise over a 40°C ambient while using 155°C (class F) insulation materials. Motors meet applicable UL, CSA, and CE requirements and include thermistors.

Additional Options:

- Holding Brakes
- Shaft sealing options available
- Feedback devices
- Shaft and mounting variations
- Custom windings
- Connectivity

Kollmorgen Cables Offer the Complete Solution

Kollmorgen offers complete cable solutions for connecting drives and motors. This includes static, low cost cable sets for simple applications to high bend, high flex, hybrid cables that combine feedback and power in one cable. Not sure which cable offering would best suit your needs? No problem. Kollmorgen Customer Support is available to discuss cable options and what makes the most sense for your machine.

▶ AKD[®] Servo Drive

Our AKD series is a complete range of Ethernet-based servo drives that are fast, feature-rich, flexible and integrate quickly and easily into any application. AKD ensures plug-and-play commissioning for instant, seamless access to everything in your machine. And, no matter what your application demands, AKD offers industry-leading servo performance, communication options, and power levels, all in a smaller footprint.

This robust, technologically advanced family of drives delivers optimized performance when paired with our best-in-class components, producing higher quality results at greater speeds and more uptime. With Kollmorgen servo components, we can help you increase your machine's overall equipment effectiveness (OEE) by 50%.

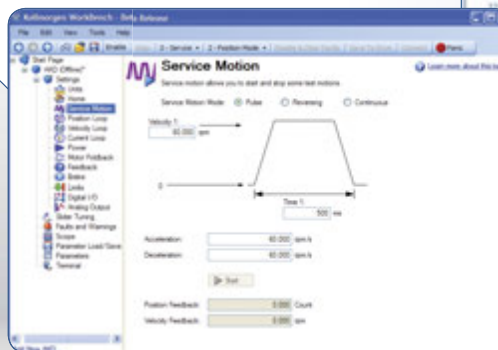

The Benefits of AKD Servo Drive

- | | |
|---|--|
| <ul style="list-style-type: none"> • Optimized Performance in Seconds | <ul style="list-style-type: none"> • Auto-tuning is one of the best and fastest in the industry • Automatically adjusts all gains, including observers • Immediate and adaptive response to dynamic loads • Precise control of all motor types • Compensation for stiff and compliant transmission and couplings |
| <ul style="list-style-type: none"> • Greater Throughput and Accuracy | <ul style="list-style-type: none"> • Up to 27-bit-resolution feedback yields unmatched precision and excellent repeatability • Very fast settling times result from a powerful dual processor system that executes industry-leading and patent pending servo algorithms with high resolution • Advanced servo techniques such as high-order observer and bi-quad filters yield industry-leading machine performance • Highest bandwidth torque-and-velocity loops. Fastest digital current loop in the market |
| <ul style="list-style-type: none"> • Easy-to-use Graphical User Interface (GUI) for Faster Commissioning and Troubleshooting | <ul style="list-style-type: none"> • Six-channel real-time software oscilloscope commissions and diagnoses quickly • Multi-function Bode Plot allows users to quickly evaluate performance • Auto-complete of programmable commands saves looking up parameter names • One-click capture and sharing of program plots and parameter settings allow you to send machine performance data instantly • Widest range of programming options in the industry |
| <ul style="list-style-type: none"> • Flexible and Scalable to Meet any Application | <ul style="list-style-type: none"> • 3 to 48 Arms continuous current; 9 to 96 Arms peak • Very high power density enables an extremely small package • True plug-and-play with all standard Kollmorgen servo motors and actuators • Supports a variety of single and multi-turn feedback devices—Smart Feedback Device (SFD), EnDat2.2, 01, BiSS, analog Sine/Cos encoder, incremental encoder, HIPERFACE®, and resolver • Tightly integrated Ethernet motion buses without the need to add large hardware: EtherCAT®, SynqNet®, Modbus® TCP, EtherNet/IP™, PROFINET® RT, SERCOS® III, and CANopen® • Scalable programmability from base torque-and-velocity through multi-axis master |

Scalable Programmability

Kollmorgen delivers cutting-edge technology and performance with the AKD® servo drive and KAS controls platform. Whether your application requires a single axis or over 100 fully synchronized axes, Kollmorgen's intuitive software and tools scale to meet your needs. From simple analog torque control to the latest high-performance automation network, the AKD servo drive packs power and flexibility for virtually any application into one of the most compact footprints of any digital servo drive in the industry.

- Patented auto-tuning delivers optimized performance in seconds.
- 1.5MHz current loop and 16KHz velocity loops offers greater bandwidth and performance
Optimized performance in seconds
- Greater throughput and accuracy
- Easy-to-use Graphical User Interface (GUI) for faster commissioning and troubleshooting
- Flexible and scalable to meet any application

Motion Tasking ("P" Option)

- Controlled by analog torque-and-velocity commands
- Includes electronic gearing via X9 connector
- Includes access to 11 digital I/O and 2 analog I/O on base drive
- Includes 2 high-speed digital inputs
- Expandable to 31 digital I/O and 4 analog I/O
- Adds simple point-and-click indexing to base drive
- Provides user with pre-programmed options
- Guides novice user through simplified steps to create indexing moves
- Network connectivity to EtherCAT®, CANopen®, Profinet® RT, Ethernet/IP™, TCP/IP, SynqNet® and others
- MODBUS port for communication with HMI

BASIC Programmable 1.5 Axis Drive ("T" Option)

- Adds BASIC programmability to base AKD
- 4KHz programmable interrupt service routines
- Conditional statements, built-in math functions, user functions and subroutines
- Includes 2 high-speed digital inputs
- Same package size as base drive
- Expandable to 31 digital I/O and 4 analog I/O
- Optional integrated SD card for easy backup and drive cloning
- Includes electronic camming functionality

Basic Operation

Single-Axis

RANGE OF KOLLMORGEN AUTOMATION SUITE C

Programmable Drive Multi-Axis Master PDMM ("M" Option)

- Scalable solution for use as a single-axis drive with integrated programmable automation controller
- Choose from all five IEC 61131-3 languages for soft PLC process programming
- Program motion using your choice of PLCopen for motion or our innovative Pipe Network™
- 4KHz PLC scan rate and EtherCAT® updates
- Complete line of HMI panels with integrated software to simplify GUI development
- Exclusive function blocks, such as "wait," enable your program to act as a scanning or sequential language
- On-board I/O includes 17 digital (with 2 high speed inputs) and 2 analog
- Connects to AKT™ network I/O for nearly unlimited expandability

Seamlessly add additional axes and AKD PDMM serves as a high-performance multi-axis machine controller

- SD card for easy backup and system updates
- IoT-enabled integrated webserver for diagnostics and troubleshooting from any computer or mobile device
- Provide true synchronized-path control of up to 16 axes
- Reduce cabinet size and wiring requirements with a single, compact package
- Easily manage remote I/O and the I/O of all attached drives via EtherCAT®
- Use industry standard PCLopen for motion, or step up to Kollmorgen's Pipe Network™ to program sophisticated camming and gearing applications in a matter of minutes

SCALABLE PROGRAMMABILITY

Pipe Network™

Kollmorgen Visual Motion Programming

- Accelerate development by programming tasks in hours that would otherwise take weeks
- Improved coding quality through visual programming and by using pre-built modules that have been thoroughly tested and optimized
- Easy knowledge transfer, replacing pages of complex code with easily understood graphical representations
- Available on PDMM controllers

Pipe Network provides a one-to-one translation of a mechanical system into a logical world as shown in the Vertical Form Fill and Seal machine above. Click and build your motion program in minutes, or contact Kollmorgen for examples of common machine architectures to further accelerate your development.

AKD[®] BASIC Drives

High Performance Capabilities in an Integrated Drive/Control Solution

Add co-engineering to your toolbox. Save money, simplify your machine and customize performance to meet the specific needs of each customer or application – as needed, today or tomorrow.

Our new Kollmorgen AKD[®] BASIC drives add BASIC-programmable machine and motion control to the superior performance of our AKD drive platform. So engineers can quickly customize performance at the drive level without touching the PLC. In fact, for many applications you can avoid the expense, wiring and cabinet space of a PLC altogether.

Whether you rely on your own engineering expertise or Kollmorgen's, the base and Expanded I/O versions of our AKD BASIC drive give you the unprecedented machine and motion control flexibility in a compact, fully integrated drive package. It's one more example of our co-engineering mission to help you deliver exactly what your customers want – when they want it – in solutions that are more cost-effective to build, simpler in design and faster to market.

AKD BASIC Language Programmable Drive

In addition to the wide selection and key features of our proven AKD, the standard version of our AKD BASIC drive offers:

- **Programmable machine control built into the drive**, so you can engineer perfect axis-level performance without touching the machine controller. In fact, AKD BASIC can eliminate the need for a PLC in single and 1.5 axis applications – reducing wiring requirements, panel space, design complexity and cost.
- **High performance motion control built into the drive**, enabling increased speed for more complex moves in a simpler design with reduced wiring.
- **BASIC Language programming**, providing simple program flow control in a solution that's easy to learn, quick to master and universally accepted.
- **An integrated development environment**, allowing single-point programming, de-bugging, commissioning, tuning and management of your AKD BASIC drive from within AKD WorkBench. Our BASIC editor provides innovative features that speed development time and reduce coding errors.
- **Source code lockout with password protection**, freeing you to differentiate your product with drive-level control while safeguarding your intellectual property.

I/O Capabilities	Base Version	Expanded I/O Version
Digital Inputs	8	20
Digital Outputs	3	13
Analog Inputs	1	2
Analog Outputs	1	2

Expanded I/O AKD BASIC Programmable Drive

Building on the features of the AKD BASIC drive, we also offer an expanded I/O version that adds:

- **A total of 20 digital inputs, 13 digital outputs, 2 analog inputs and 2 analog outputs**, reducing or eliminating the need for remote I/O and its associated installation and wiring costs.
- **An SD memory card slot** for loading, and restoring programs and parameters, without the need for a PC.

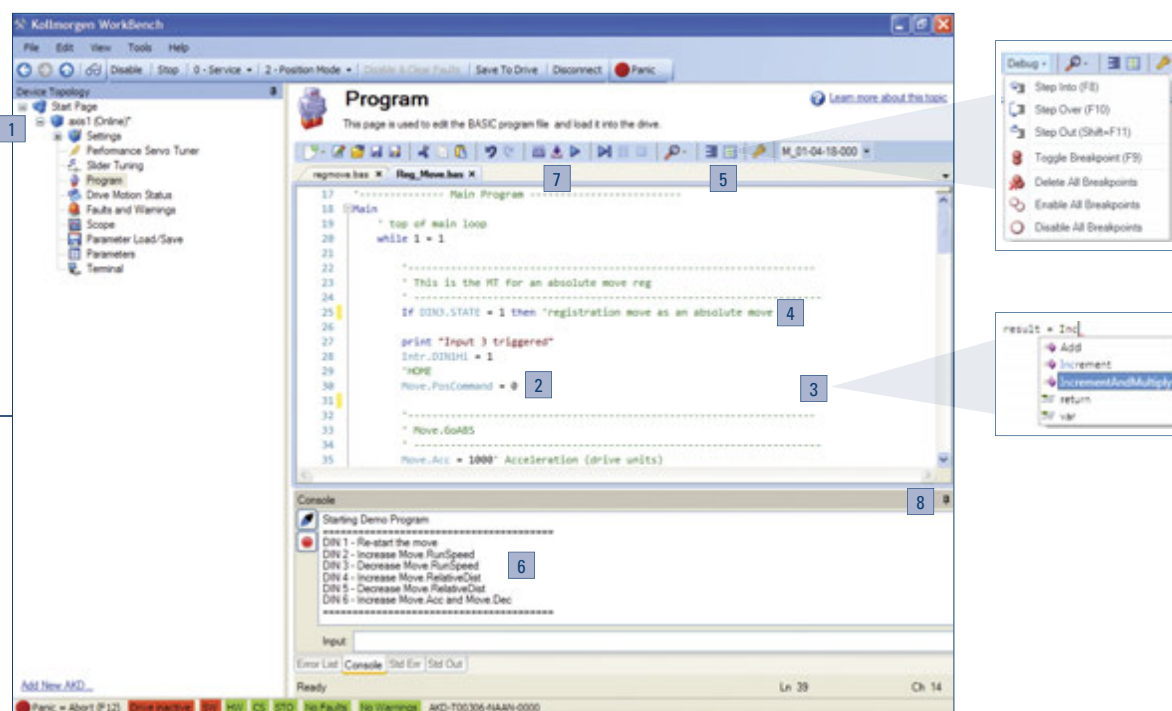

Development Tools that Speed Programming and Improve Quality

Co-engineering is a powerful tool. To make it easy for you to provide better solutions for your customers, we provide an innovative BASIC programming environment within Kollmorgen WorkBench. So there's only one software package to use for all of your drive setup, configuration, tuning and management tasks in addition to motion and machine control programming.

Pre-built code templates give your application a head-start, while automatic formatting, highlighting and other ease-of-use features increase programming speed and accuracy. Complete access to all programming capabilities and drive features within a single environment helps speed your development of complete, optimally engineered solutions.

Novice users will enjoy a short ramp-up time to productive coding, while experienced users will discover well-designed tools that take their programming skills to new levels of speed and quality.

- 1 Integrated axis setup
- 2 Code snippets simplify formatting
- 3 Auto-complete helps speed coding and reduce errors
- 4 Automatic color coding makes it easy to distinguish comments, parameters, print statements and other types of code
- 5 Full debugger accelerates development
- 6 Packaged program console provides instant program status
- 7 Menu-driven navigation provides intuitive look and feel
- 8 Window pinning maximizes workspace

AKD[®] PDMM Drive-Resident Controller

Build Simpler and Better with Drive-Resident Machine and Motion Control

Extend your design options. Control as many as eight axes or more without the need for a PLC or PAC. Reduce cabinet space and wiring requirements. Program perfect machine and motion control for any project using a single, fully integrated programming environment. Build a better machine at a lower cost.

Our new addition to the AKD[®] drive family combines one servo axis, a master controller that supports multiple additional axes, and the full automation capability of Kollmorgen Automation Suite[™]—all in a single, compact package.

Welcome to the AKD[®] PDMM programmable drive, multi-axis master.

Performance Specifications

Features

- Kollmorgen Automation Suite[™] provides fully integrated programming, testing, setup and commissioning
- Embedded web server utility simplifies service
- Control 32 axes or more* while reducing machine footprint
 - EtherCAT[®] multi-axis master motion controller integrated with a standard AKD[®] drive axis
 - Full IEC61131-3 soft PLC for machine control, with support for all 5 programming languages
 - Choice of PLCopen for motion or Pipe Network[™] for programming motion control
 - 32 KB non-volatile memory stores machine data to eliminate scrap upon restart after power failure
 - SD Card slot simplifies backup and commissioning, with no PC required
 - On-board I/O includes 13 digital inputs, 4 digital outputs, 1 analog input, 1 analog output (expandable with AKT series of remote I/O)
- Works with Kollmorgen Visualization Builder for programming AKI human-machine interface panels

*Maximum axis count depends on motion/automation complexity and performance (8 axes nominal based on medium complexity at 4 kHz network update rate)

A Single, Scalable Development Suite

Kollmorgen Automation Suite™ simplifies and accelerates development through a unified system of software, hardware, and collaborative co-engineering. This scalable solution provides a fully integrated development environment for any application, whether you're programming a single axis of motion, a multi-axis AKD® PDMM system, or a PCMM-based system up to 64 axes or more. Kollmorgen Automation Suite has been proven to:

- Improve product throughput by up to 25% with industry-leading motion bandwidth
- Reduce scrap by up to 50% with world-class servo accuracy, seamless power-failure recovery and highly dynamic changeovers
- Increase precision for better quality, reduced waste and less downtime using EtherCAT®—the field bus with motion bus performance
- Enable more adaptable, sustainable and innovative machines that measurably improve marketability and profitability

A Single Family of Servo Drives

Kollmorgen AKD® servo drives deliver cutting-edge performance in a compact footprint. From basic torque-and-velocity applications, to indexing, to multi-axis programmable motion, these feature-rich drives offer:

- Plug-and-play compatibility with your servo motor
- All the advantages of Kollmorgen's breadth of motor platforms including AKM®, CDDR®, and other direct-drive technologies
- The fastest velocity and position loop updates
- Full-frequency auto-tuning for perfect motion across the performance spectrum
- Real-time feedback from a wide variety of devices

Our Best Drive and Automation Solution in a Single Package

The AKD PDMM programmable drive, multi-axis master combines our AKD drive platform with the full feature set of Kollmorgen Automation Suite in a single package—providing complete machine and motion control for up to eight axes or more.

You need only one development suite and one drive family for all your projects. And you can rely on one source for all the motion components and co-engineering expertise you need to build a better machine.

With AKD PDMM, the best in machine engineering has never been easier, faster or more cost-effective.

Servo Drive Accessories

Ethernet Connectivity

- Ethernet-based AKD servo drive provides the user with multiple bus choices
- EtherCAT® (DSP402 protocol), Modbus® TCP, SynqNet®, EtherNet/IP™, PROFINET® RT, SERCOS III, and CANopen®
- No option cards are required

Industrial Design

- Rugged circuit design and compact enclosure for space-saving, modern appearance – minimizes electrical noise emission and susceptibility
- Full fault protection
- UL, cUL listed, CE, and EAC
- No external line filters needed (480 Vac units) for CE & UL compliance
- Removable screw terminal connectors for easy connections
- DC Bus sharing

Safe-Torque-Off (STO)

- Switches off the power stage to ensure personnel safety and prevents an unintended restart of the drive, even in fault condition
- Allows logic and communication to remain on during power stage shut down
- AKD-x003 – AKD-x024: SIL2 / PL d
- AKD-x048: SIL3 / PL e

Internal Regenerative Braking Resistor

(all models except 120/240 V AC 3 Aeff and 6 Aeff , as well as 480 V AC, 48 Aeff)

- Simplifies system components
- Saves overhead of managing external regeneration when internal regeneration is sufficient

Performance Servo Tuner (PST)

- Exclusive patent pending auto-tuner reaches optimized set-up in seconds
- Handles inertia mismatches up to 1000:1
- Industry leading bandwidth under compliant and stiff load conditions, no matter the mechanical bandwidth of the machine

Plug-and-Play with Kollmorgen Motors and Actuators

- Electronic motor nameplates allow parameters to automatically load for fast commissioning
- Motion in seconds
- Custom motor parameters easily entered

I/O (Base Drive)

- 8 digital inputs (1 dedicated to enable)
- 2 high-speed digital inputs (maximum time delay of 1.0 µs)
- 3 digital outputs (1 dedicated to fault relay)
- 1 analog input - 16 bit
- 1 analog output - 16 bit

AKD 120/240 Vac Connector Layout

AKD 240/480 Vac Connector Layout

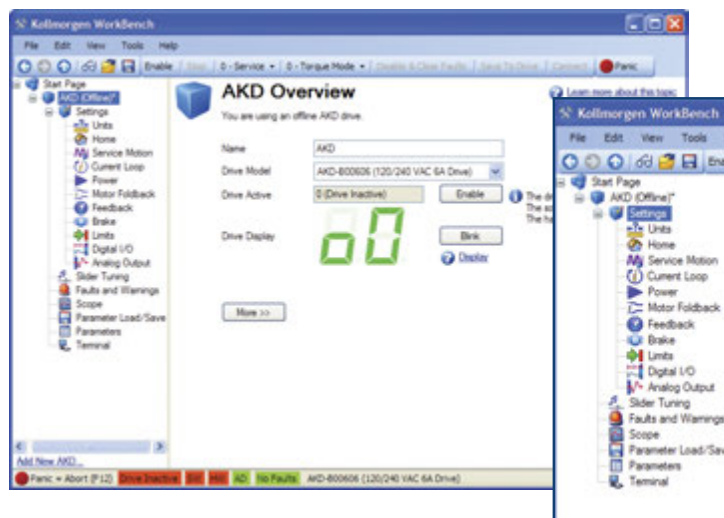

Kollmorgen Workbench

Our simple Graphical User Interface (GUI), Kollmorgen WorkBench, is designed to expedite and streamline the user's experience with the AKD® servo drive. From easy application selection and reduced math, to a sleek six-channel scope; the user interface is extremely easy to use. Kollmorgen WorkBench supports intuitive access to the exclusive Performance Servo Tuner (PST) available inside AKD. The patent pending PST makes auto-tuning the AKD high-performance servo drive with world-class Kollmorgen motors very simple.

User-Friendly Environment

Logical flow, colorful icons and easy access simplify interactions with the AKD servo drive. The folder structure allows for instant identification and easy navigation.

Sleek Six-Channel "Real-Time" Software Oscilloscope

The easy-to-use AKD servo drive interface has a sleek digital oscilloscope that provides a comfortable environment for users to monitor performance. There are multiple options to share data in the format you prefer at the click of a button.

- Save as an image
- Load to an e-mail
- Print

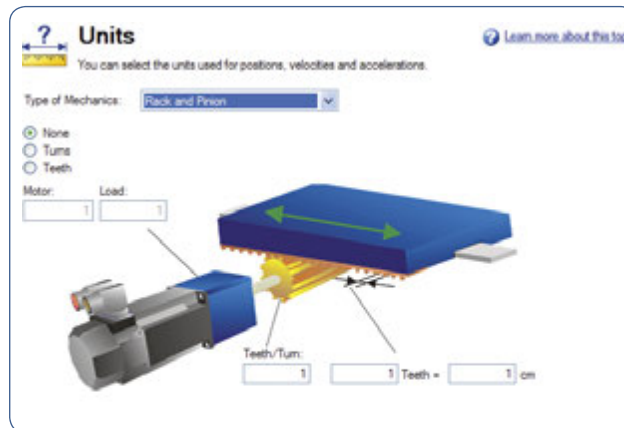

Application Selection

Simplifies set-up by allowing use of machine or application-based units. Nip roller and rack and pinion set-ups shown.

Nip Roller Application Selection

Rack and Pinion Application Selection

Data-Sharing

The ease-of-sharing continues in the parameters window. Kollmorgen WorkBench provides the user the easy options of printing or emailing the parameter values at the click of a button.

Parameters

This page lists all the current values of all the drive parameters on the drive.

Full Name	Value	Units	Parameter	Read/Write
Active Disable				
Deceleration during active disable	3000.000	rpm/s	AD.DEC	read-write
Time-out	1000	ms	AD.DISTO	read-write
State	0	ms	AD.STATE	read-only

AKD[®] Servo Drive

Feedback & I/O

AKD[®] servo drive is specifically designed with the versatility, communications, and power you need to expand machine performance and increase integration speeds. Motor set-up is plug-and-play and multiple Ethernet connectivity options provide both open and closed protocols. Online troubleshooting and data verification enable faster, bug-proof programming. And a broad power range in a smaller, compact design allows you to use these robust drives with a single interface while experiencing industry-leading, high-performance servo loops.

AKD Specifications

	Standard Drive	With I/O expansion - AKD-T only
Encoder Output or AUX Encoder Input	2.5 MHz Maximum line frequency	
Feedback	Smart Feedback Device (SFD), EnDat2.2, EnDat2.1, BiSS, analog Sine/Cos encoder, incremental encoder, HIPERFACE [®] , and resolver	
Logic supply	24 Vdc	
Digital input (24 Vdc)	8 (1 dedicated to enable)	20 (1 dedicated to enable)
Digital output (24 Vdc)	3 (1 dedicated to fault relay)	13 (1 dedicated to fault relay)
Analog input (+/- 10 Vdc, 16-bit)	1	2
Analog output (+/- 10 Vdc, 16-bit)	1	2
Programmable inputs	7	19
Programmable outputs	2	12
Sink/Source inputs/outputs	Yes	Yes

Servo Drive Accessories

Mating Connectors and Shielding Kit

Kollmorgen's servo drives are equipped with screwable mating connectors. Alternative connectors for common DC, bus, and main ports are also available. We offer shielding kits for our flexible cables for use in environments with strong interference.

Shielding Solutions

AKD servo drives can be equipped with shielding plates.

Brake Resistors

We offer a full line of brake resistors up to 6000 watts. Brake resistors are impedance matched with AKD and are available in many sizes and form factors.

Chokes and Filters

Line filters are offered to improve reliability and to protect the life of the machine in less stable environments. Motor chokes reduce radiated emissions and are recommended for applications with cable lengths >25 meters.

Linear Positioning

Rod Type or Rodless?

Rod Type electric cylinders are similar in configuration to a hydraulic or pneumatic actuator and are preferred when you need to position an externally supported load, move a load that pivots, retrofit a hydraulic or pneumatic actuator, or have "reach in requirements".

EC and N2 electric cylinders (see the N2 series figure, right) use ballscrews (1) to convert rotary motion into linear motion. The motor (2) is mounted to the bearing housing (3), and the motor's power is transmitted to the screw through a gear, or timing-belt reduction (4). The screw turns and moves the ball nut (5), which is connected to a guide flange (6). The guide flange keeps the nut from rotating, by sliding through the guide cylinder (7). The thrust tube (8) is threaded on to the nut, and is supported by the sleeve bearing (9) in the rod-end housing (10). The load is attached to the rod end (11).

| 2. Motor | 5. Ball Nut | 8. Thrust Tube | 11. Rod End |
| 3. Bearing Housing | 6. Guide Flange | 9. Sleeve Bearing | |

Rodless actuators have a bearing support system and a carriage that runs the length of the body. This type of actuator is preferred when you need to save space by eliminating external guides and ways, when high speed and long stroke lengths are needed, when the shortest overall work envelope is needed, or when a multi axis Cartesian System is required.

R2A, R3 and R4 rodless actuators use a ballscrew or a transport belt to convert the motor's power to linear thrust. Pictured below is a belt-drive positioner. As in the EC and N2 electric cylinders, there is a timing belt, or gear reduction (1) between the motor (2) and the driven pulley (3). The transport belt (4) runs over two pulleys and each end is connected to the connector bracket (5). The connector bracket is connected to two bearing blocks (6) that ride on the recirculating ball-bearing rail (7) that is mounted in the guide cylinder (8). The carriage (9) is mounted to the connector bracket and the seal strip (10) runs between them. The connector bracket lifts the seal as the carriage moves, while roller wheels (11) in the carriage push the seal back in place.

R2A Actuators have no bearing blocks, but instead have roller wheels for bearing support (as seen in the figure below). Four track-roller bearings run on two hardened and ground steel shafts, pressed into the extrusion.

Linear Actuation Operation

Rotary to Linear Conversion

Linear motion systems driven by rotating electric motors commonly employ one of three rotary-to-linear conversion systems: **ballscrew, belt drive, or lead screw**.

Ballscrew

The majority of linear motion applications convert motor torque to linear thrust using ballscrews due to their ability to convert more than 90% of the motor's torque to thrust. As seen below the ballnut uses one or more circuits of recirculating steel balls which roll between the nut and ballscrew threads. Ballscrews provide an effective solution when the application requires:

- High efficiency - low friction
- High duty cycle (> 50%)
- Long life - low wear

Ball / Lead Screw

Screw-drive mechanisms, whether lead screw or ballscrew provide high thrust (to thousands of pounds), but are often limited by critical speed, maximum recirculation speed of ball nut circuits, or sliding friction of lead nut systems.

Lead Screw

The lead screw uses a plastic or bronze solid nut that slides along the threads of the screw, much like an ordinary nut and bolt. Since there are no rolling elements between the nut and the lead screw, lead screws yield only 30-50% of the motor's energy to driving the load. The remaining energy is lost to friction and dissipated as heat. This heat generation limits the duty cycle to less than 50%. A great benefit of the lead screw is its ability to hold a vertical load in a power-off situation (refer to the Backdrive specifications for lead screw positioners). The lead screw is a good choice for applications requiring:

- Low speeds
- Low duty cycles (50%)
- The ability to hold position while motor power is off

Electric Cylinder Vs. Hydraulics & Pneumatics

Linear Technology Comparison

For many applications, hydraulic or pneumatic linear cylinders are a better choice than their electromechanical alternatives. For example, when extremely heavy loads (>25,000 N [5,620 lb]) must be moved, hydraulic cylinders are usually the best solution.

Or, when very light loads must be moved rapidly and repeatedly from one fixed location to another fixed location, pneumatic cylinders may be the most economical solution.

	Kollmorgen Electric Cylinders	Hydraulic Cylinders	Pneumatic Cylinders
Installation	All electric operation requires simple wiring; directly compatible with other electronic controls.	Requires expensive plumbing, filtering, pumps, etc. Must pay close attention to compatibility of components.	Requires expensive plumbing, filtering, pumps, etc.
Precise Positioning	Cost-effective, repeatable (to ± 0.013 mm [± 0.0005 in]), rigid multi-stop capabilities.	Requires expensive position sensing and precise electro-hydraulic valving to implement; has tendency to creep.	Most difficult to achieve. Requires expensive position sensing and precise valving to implement; has tendency to creep.
Control	Solid-state microprocessor-based controls allow automatic operation of complex motion sequences.	Requires electronic/fluid interfaces and sometimes exotic valve designs. Hysteresis, dead zone, supply pressure and temperature changes complicate control.	Inherently non-linear, compressible power source severely complicates servo control. Compressibility can be an advantage in open loop operation.
Speed	Smooth, variable speed capabilities from 0.5 to 1330 mm/sec [0.02 to 52.5 in/sec].	Difficult to control accurately. Varies with temperature and wear. Stick slip can be a problem.	More susceptible to stick slip and varying load. Well-suited for high speed applications to 5 m/sec [200 in/sec].
Reliability	Repeatable, reproducible performance throughout useful life of product; little maintenance required.	Very contamination sensitive. Fluid sources require maintenance. Seals are prone to leak. Good reliability with diligent maintenance.	Very contamination sensitive. Air sources require proper filtration. Good reliability, but usually many system components are involved.
Power	Up to 25,000 N [5620 lb], 3 kW [4 hp].	Virtually unlimited force. Most powerful.	Up to 5,000 lb. Typically used below 0.75 kw [1 hp].
Cycle Life	Up to millions of cycles at rated load. Easy to predict.	Dependent on design and seal wear; usually good.	Dependent on seal wear, usually good.
Environment	Standard models rated for -20° to 160° F. Inherently clean and energy efficient.	Temperature extremes can be a major problem. Seals are prone to leak. Waste disposal is increasingly problematic.	Temperature extremes can be a major problem. Seals prone to leak. Air-borne oil can be a problem.
Safe Load Holding	Lead screw units are self-locking if power fails. Fail-safe brakes available for ball-screw models.	Complex back-up safety devices must be used.	Complex back-up safety devices must be used.
Cost	Moderate initial cost; very low operating cost.	Components often cost less, but installation and maintenance are increased. Hydraulic power unit cost is high if not pre-existing. Most economical above 7.5 kw [10 hp].	Components often cost less, but installation and maintenance are increased. Most cost-effective for low power, simple point-to-point applications.

Automation Control

But when simplicity, flexibility, programmability, accuracy and reliability are important and loads are within the capacity of the technology, electromechanical solutions often are the most desirable.

Further, electromechanical systems are inherently more compatible with today's automation controls.

Linear Sizing Calculations

Move Profile

Rotary and linear actuator selection begins with the calculation of speed, thrust and torque requirements. In order to determine the torque required, the acceleration of the mass being moved must be calculated. A “**move profile**”, or a **plot of load velocity vs. time**, is sketched in order to simplify the **peak acceleration** and **peak velocity** calculations.

Typical Machine Cycle

(1) Total distance,
$$d_{\text{tot}} = v_{\text{MAX}} \left[\frac{t_1}{2} + t_2 + \frac{t_3}{2} \right]$$

(2) Max velocity,
$$v_{\text{MAX}} = \frac{d_{\text{tot}}}{\left(\frac{t_1 + t_3}{2} \right) + t_2}$$

(3) Acceleration,
$$a = \frac{v_{\text{MAX}}}{t_{\text{ACCEL}}}$$

The figure above is an example of a typical machine cycle, and is made up of two Move Profiles; the first is an example of a **trapezoidal profile**, while the second is a **triangular profile**. The horizontal axis represents time and the vertical axis represents velocity (linear or rotary). The load accelerates for a time (t_1), has a constant velocity or slew section (t_2), and decelerates to a stop (t_3). There it dwells for a time, accelerates in the negative direction (t_4), and decelerates back to a stop (t_5) without a slew region. The equations needed to calculate Peak Velocity and Acceleration for a general trapezoidal profile are shown in the figure. A triangular profile can be thought of as a trapezoidal profile where $t_2 = 0$.

The Move Profile sketch contains some important information:

- **Peak acceleration** is the steepest slope on the curve, in this case during t_4 or t_5 .
- **Maximum velocity** is at the highest or lowest point over the entire curve, here at the peak between t_4 and t_5 .
- **Distance** is equal to the area under the curve. Area above the time axis represents distance covered in the positive direction, while negative distance falls below this axis. The distance equation (1) is just a sum of the areas of two triangles and a rectangle.

Trapezoidal and Triangular Profiles

A couple of assumptions can greatly simplify the general equations. For the Trapezoidal profile we assume $t_1 = t_2 = t_3$, and for the Triangular we assume $t_3 = t_4$. Substituting these assumptions into equations (2) and (3) yields the equations shown in the figure below.

For a given distance (or area), a triangular profile requires lower acceleration than the trapezoidal profile. This results in a lower thrust requirement, and in turn, a smaller motor. On the other hand, the triangular profile's peak speed is greater than the trapezoidal, so for applications where the motor speed is a limiting factor, a trapezoidal profile is usually a better choice.

Trapezoidal Move Profile

$$v_{\text{AVE}} = \frac{d_{\text{tot}}}{t_{\text{tot}}}$$

$$t_1 = t_2 = t_3 = \frac{t_{\text{tot}}}{3}$$

$$v_{\text{MAX}} = 1.5 \frac{d_{\text{tot}}}{t_{\text{tot}}} = 1.5 v_{\text{AVE}}$$

$$a = 4.5 \frac{d_{\text{tot}}}{(t_{\text{tot}})^2}$$

Triangular Move Profile

$$v_{\text{AVE}} = \frac{d_{\text{tot}}}{t_{\text{tot}}}$$

$$t_1 = t_3 = \frac{t_{\text{tot}}}{2} \quad t_2 = 0$$

$$v_{\text{MAX}} = \frac{2d_{\text{tot}}}{t_{\text{tot}}} = 2 v_{\text{AVE}}$$

$$a = \frac{4d_{\text{tot}}}{(t_{\text{tot}})^2} = \frac{2v_{\text{MAX}}}{t_{\text{tot}}}$$

Move Profile

Example 1

Calculate the peak acceleration and velocity for an object that needs to move 30 inches in 2.5 seconds. Assume a Trapezoidal Profile.

Solution

$$v_{AVE} = \frac{30 \text{ in}}{2.5 \text{ sec}} = 12 \text{ in/sec}$$

$$v_{MAX} = 1.5 \frac{d_{tot}}{t_{tot}} = 18 \text{ in/sec}$$

$$a = 4.5 \frac{d_{tot}}{(t_{tot})^2} = 21.6 \text{ in/sec}^2$$

Example 2

Calculate, in radians/sec, the peak acceleration and velocity for an cylinder that needs to move 5 revolutions in 0.4 seconds. Assume a Triangular Profile.

Solution

$$d_{tot} = \frac{5 \text{ revs} \times 2\pi \text{ rad}}{\text{rev}} = 31.42 \text{ rad}$$

$$v_{AVE} = \frac{31.42 \text{ rad in}}{0.4 \text{ sec}} = 78.55 \frac{\text{rad}}{\text{sec}}$$

$$v_{MAX} = 2 v_{AVE} = 157.1 \frac{\text{rad}}{\text{sec}}$$

$$a = 4 \frac{d_{tot}}{T^2} = 785.5 \frac{\text{rad}}{\text{sec}^2}$$

Example 3

This is an example of a case when triangular and trapezoidal move profiles are not adequate approximations. Assume a maximum positioner speed is 6 inches/sec. Sketch a move profile that will complete a 10 inch move in 2 seconds. What is the minimum allowable acceleration rate in inches/sec²?

Solution

Triangular

$$v_{AVE} = \frac{10 \text{ in}}{2 \text{ sec}} = 5 \text{ in/sec}$$

$$v_{MAX} = 2 \times v_{AVE} = 10 \text{ in/sec} (v_{MAX} > 6 \text{ in/sec} - \text{too fast})$$

Trapezoidal

$$v_{MAX} = 1.5 \times v_{AVE} = 7.5 \text{ in/sec} (v_{MAX} > 6 \text{ in/sec} - \text{too fast})$$

These are too fast, so we need to find t_1 as follows:

Required Profile

$$d_{tot} = v_{MAX} \left(\frac{(t_1 + t_3)}{2} + t_2 \right)$$

$$\frac{d}{v_{MAX}} = \left(\frac{(t_{tot} - t_2)}{2} \right) + t_2 = \frac{t_{tot}}{2} + \frac{t_2}{2}$$

solving for t_2 ,

$$t_2 = \left(\frac{d_{tot} - \frac{v_{MAX} t_{tot}}{2}}{v_{MAX}} \right) \times 2 = \left(\frac{10 \text{ in}}{6 \text{ in/sec}} - \frac{2 \text{ sec}}{2} \right) \times 2$$

$$t_2 = 1.33 \text{ sec}$$

Now assume $t_1 = t_3$, so

$$t_1 = (t_{tot} - t_2)/2 = 0.33 \text{ sec.}$$

Finally, calculate acceleration

$$a = \frac{v_{MAX}}{t_1} = \frac{6 \text{ in/sec}}{0.33 \text{ sec}} = 18 \frac{\text{in}}{\text{sec}^2}$$

Linear Sizing Calculations

Thrust Calculation

The thrust required to move a mass a given distance within a given time may be calculated by summing all of the forces that act on the mass.

These forces generally fall within the following four categories:

- **Gravity** is important when something is being raised or lowered in a system. Lifting a mass vertically is one example, as is sliding something on an incline.
- **Friction forces** exist in almost all systems and must be considered.
- **Applied forces** come from springs, other actuators, magnets, etc., and are the forces that act on the mass other than friction, gravity, and the actuator's thrust. The spring shown in the figure below is an example of an Applied force.
- **Actuator thrust** is the required force, and is what we need to determine.

The figure above shows a general case where the force required by the actuator must be determined. All of the above forces are included, and it is important to note that all of these forces can change over time, so the thrust must be calculated for each section of the move profile. The worst case thrust and speed required should be used to pick the appropriate actuator. All of these forces added up (Σ) must be equal to mass \times acceleration, or:

$$\Sigma F = m \times a, \text{ or,} \quad (1)$$

$$F_{\text{actuator}} - F_{\text{applied}} - F_{\text{friction}} - F_{\text{gravity}} = ma = \left(\frac{W_t}{g} \right) a \quad (2)$$

$$F_{\text{actuator}} = \left(\frac{W_t}{g} \right) a + F_{\text{applied}} + F_{\text{friction}} + F_{\text{gravity}} \quad (3)$$

$$\text{where } W_t = W_{\text{load}} + W_{\text{actuator}} \quad (4)$$

$$F_{\text{friction}} = \mu W_L \cos \theta, \text{ and}$$

$$F_{\text{gravity}} = W_L \sin \theta$$

W_{actuator} becomes important when the acceleration force, $(W_t/g)a$, is a significant part of the thrust calculation. For simplicity, start by neglecting this weight, and calculate the required thrust without it. After selecting an actuator, add its mass to the mass of the load and recalculate. To make these equations clear, let's begin with an example.

Example 1

We would like to move a 200 lb weight a distance of 10 inches in 2 seconds. The mass slides up an incline with a friction coefficient of 0.1 at an angle of 45°. There is a spring that will be in contact with the mass during the last 0.5 inch of travel and has a spring rate of 100 lb/in. What is the maximum thrust and velocity?

Solution

We need to look at the thrust requirement during each part of the move, and find the points of maximum thrust and maximum speed. Choosing a trapezoidal profile we calculate that v_{max} is 7.5 in/sec and the peak acceleration is 11.25 in/sec² (see Move Profile Section).

Acceleration Section:

$$\begin{aligned} Ma &= 200 \text{ lb} / 386 \text{ in/sec}^2 \times 11.25 \text{ in/sec}^2 \\ &= 5.83 \text{ lb} \end{aligned}$$

$$\begin{aligned} F_{\text{applied}} &= 0 \text{ lb} \\ F_{\text{friction}} &= [200 \text{ lb} \times \cos(45)] \times 0.1 = 14.14 \text{ lb} \\ F_{\text{gravity}} &= 200 \text{ lb} \times \sin(45) = 141.4 \text{ lb} \\ F_{\text{total}} &= 161 \text{ lb} \end{aligned}$$

Slew Section:

$$\begin{aligned} Ma &= 0 \text{ lb (since } a=0) \\ F_{\text{applied}} &= 0 \text{ lb} \\ F_{\text{friction}} &= [200 \text{ lb} \times \cos(45)] \times 0.1 = 14.14 \text{ lb} \\ F_{\text{gravity}} &= 200 \text{ lb} \times \sin(45) = 141.4 \text{ lb} \\ F_{\text{total}} &= 156 \text{ lb} \end{aligned}$$

Deceleration Section:

$$\begin{aligned} Ma &= 200 \text{ lb} / 386 \text{ in/sec}^2 \times -11.25 \text{ in/sec}^2 \\ &= -5.83 \text{ lb} \\ F_{\text{applied}} &= K \times x = 0.5 \text{ in} \times 100 \text{ lb/in} = 50 \text{ lb} \\ &\quad \text{(worst case)} \\ F_{\text{friction}} &= [200 \text{ lb} \times \cos(45)] \times 0.1 = 14.14 \text{ lb} \\ F_{\text{gravity}} &= 200 \text{ lb} \times \sin(45) = 141.4 \text{ lb} \\ F_{\text{total}} &= 200 \text{ lb} \end{aligned}$$

So the worst case required thrust is 200 lb. And the worst case velocity is 7.5 in/sec.

Thrust Calculation

Actuator Mass

In applications where the acceleration force, $(W_L/g)a$, is a significant part of the required thrust, the actuator mass must be considered in the thrust calculation. After an actuator is chosen, the actuator weight (linear inertia), W_{actuator} , is added to the weight of the load. W_{actuator} can be determined using the tables and equation in the actuator data section. To illustrate, we will use the previous example.

1. The first step is to pick a linear actuator with the above thrust and speed capability. One such actuator is an EC3-AKM42-20-16B-300. This is an EC3 Electric Cylinder with a AKM42 motor, a 2:1 gear reduction, a 16 mm lead ballscrew, and a 300 mm stroke.
2. The next step is to look up the effective Actuator Linear Inertia in the tables located in the particular actuator section (do not include the "load" term in the equation). An entry from this table can be seen in the table below. The AKM42 motor inertia is 0.0013 in-lb-sec². The effective actuator weight, calculated from the table is 297 lb.
3. The final step is to add this weight to the weight of the load, W_L , and recalculate the peak thrust required for each section of the move profile (do not add this weight to the gravity or friction terms):

Acceleration Section:

$$Ma = 447 \text{ lb}/386 \text{ in/sec}^2 \times 11.25 \text{ in/sec}^2$$

$$= 13.03 \text{ lb}$$

$$F_{\text{total}} = 169 \text{ lb}$$

Slew Section:

$$Ma = 0 \text{ lb (since } a=0)$$

Deceleration Section:

$$Ma = 447 \text{ lb}/386 \text{ in/sec}^2 \times -11.25 \text{ in/sec}^2$$

$$= -13.03 \text{ lb}$$

$$F_{\text{total}} = 193 \text{ lb}$$

We can see from this calculation that the addition of this extra "acceleration weight" increases the thrust required during acceleration, but reduces the peak thrust required during deceleration. The EC3-AKM42-20-16B-300 will work in the application.

Vertical and Horizontal Cases

In a vertical system, θ is 90°, $\sin 90 = 1$, and F_{gravity} is equal to W_L . Since $\cos 90 = 0$, $F_{\text{friction}} = 0$.

In a horizontal system, $\sin \theta = 0$, so gravity would play no part ($F_{\text{gravity}} = 0$), and $\cos \theta = 1$, so F_{friction} would be equal to μW_L , or 50 lb.

$$F_{\text{actuator}} = (W_L/g)a + F_{\text{applied}} + F_{\text{friction}}$$

$$F_{\text{actuator}} = (W_L/g)a + F_{\text{applied}} + \mu W_L$$

RMS Thrust

For all Servomotor applications, the RMS Thrust needs to be calculated. This thrust must fall within the continuous duty region of the linear actuator. Use the following equation when calculating RMS Thrust:

$$F_{T \text{ RMS}} = \sqrt{\frac{(F_{T \text{ ACC}})^2 t_a + (F_{T \text{ VEL}})^2 t_v + (F_{T \text{ DEC}})^2 t_d + (F_{T \text{ OFF}})^2 t_{\text{off}}}{t_a + t_v + t_d + t_{\text{off}}}}$$

Linear Motion Terminology

Linear Actuator Precision

Parameter	Definition	Dominating Factors
Absolute Accuracy	The maximum error between expected and actual position.	<ul style="list-style-type: none"> Accuracy of the motor/drive system Screw pitch error (lead accuracy) System backlash (drive train, screw and nut assembly)
Repeatability	The ability of a positioning system to return to a location during operation when approaching from the same direction, at the same speed and deceleration rate.	<ul style="list-style-type: none"> Angular repeatability of the motor/drive system System friction Changes in load, speed, and deceleration Angular resolution of the motor/drive system
Resolution	The smallest positioning increment achievable. In digital control systems, resolution is the smallest specifiable position increment.	<ul style="list-style-type: none"> Drive Train Reduction Screw Pitch Lead screw Assembly wear
Backlash	The amount of play (lost motion) between a set of moveable parts.	<ul style="list-style-type: none"> Drive train wear Spaces between moving parts

Accuracy and Repeatability

Assume three linear positioning systems each attempt five moves from an absolute zero position to absolute position "A". The individual end positions of each move are charted on a linear scale below to demonstrate their accuracy and repeatability by displaying their proximities to the expected position.

Ideal System

Degree of Accuracy	Degree of Repeatability	Comment
High	High	System 1 is both accurate and repeatable, the end positions are tightly grouped together and are close to the expected position.
Low	High	System 2 is inaccurate but repeatable, the end positions are tightly grouped around a point but are not close to the expected position.
Low	Low	System 3 is neither accurate nor repeatable, the end positions are not tightly grouped and are not close to the expected position.

Linear Actuator Precision

Backlash

The clearance between elements in a drive train or lead screw assembly which produces a mechanical “dead band” or “dead space” when changing directions, is known as the **backlash** in a system.

In most mechanical systems, some degree of backlash is necessary to reduce friction and wear. In a Kollmorgen Linear Actuator System, system backlash will typically be 0.010 – 0.015 inches. Usually 0.006 – 0.008” is attributed to the ball screw / lead screw assembly. For ball screws this will remain constant throughout the life of a cylinder, while for lead screws it will increase with wear.

Reducing the Effects of Backlash

1. Approach a stop position from the same direction.
2. Apply a constant linear force on the cylinder thrust tube or carriage. This is done automatically for cylinders used in vertical orientations with a backdriving load.
3. For programmable positioning devices it is possible to program out backlash by specifying a small incremental move (enough to take out the backlash) prior to making your normal moves in a particular direction.
4. Use a preloaded nut on a ball screw to counteract the backlash. Contact Kollmorgen about the precision ground screw option which reduces backlash in the drive nut.
5. An inline positioner with the motor directly coupled to the ball screw has less backlash than parallel or reverse parallel units which utilize a gear train or drive belt/pulley.

Primary Sources of Backlash

1. Ball screw/Lead screw Assembly

2. Drive Train (Gears, Timing Belt/Pulley)

3. Timing Belt/Pulley

4. Coupling

Linear Motion Terminology

Duty Cycle

Duty Cycle is the ratio of motor-on time to total cycle

time and is used to determine the acceptable level of running time so that the thermal limits of the motor or positioner components are not exceeded. Inefficiencies cause a temperature rise in a system, and when the temperature reaches a critical point, components fail. Letting the system to rest idle during the cycle allows these system components to cool. Duty Cycle is limited by lead screw and motor thermal limits. Use the following equation and example to determine Duty Cycle:

$$\text{Duty Cycle} = \frac{\text{ON TIME}}{\text{ON TIME} + \text{OFF TIME}} \times 100$$

Example:

$$\text{Duty Cycle} = \frac{3 \text{ sec} \times 100}{3 + 1 \text{ sec}} = 75\%$$

Leadscrew Limitations

Cylinders with **lead screws** have sliding friction surfaces and are limited to a maximum 50% duty cycle regardless of motor capability. The friction in the lead screw causes rapid heating, and continuous operation is likely to end in a ruined nut or screw. For positioner with **ballscrews** the motor is the only duty-cycle limitation when used within the listed speed vs. thrust curves in the catalog.

Motor Type

Electric motors incur heat losses via a number of paths, namely, friction, ohmic (I^2R) losses in copper windings, hysteresis and eddy current induction in magnetic core materials, and proximity and/or skin effect in windings. As a result duty cycle can be limited by the motor winding temperature limitations.

Servomotors

Linear Positioners using AKM series motors must have their peak (F_{peak}) and continuous (F_{RMS}) thrust requirements determined to establish their safe operation within an application. F_{RMS} can be determined using the RMS Thrust equation in the Thrust Calculation section. Plotting F_{RMS} on the positioner Speed vs. Thrust curve indicates the allowable limit. For ballscrew positioners, F_{RMS} must fall within the continuous duty region, while for lead screws it must also fall within the continuous limit and not exceed a 50% duty cycle within that limit. F_{peak} must fall within remaining operating envelope. The speed vs. thrust curve below is an example of proper servo electric cylinder sizing.

EC3-AKM23D-xxx-15-05B/ AKD (3 A)

Critical Speed and Column Loading

Critical Speed

All ballscrew systems have a rotational speed limit where harmonic vibrations occur. With Kollmorgen cylinders, this limit is a function of unsupported ballscrew length. Operation beyond this critical speed will cause the ballscrew to vibrate (whip violently) eventually bending or warping the screw.

Column Strength

All ballscrews have a maximum column loading limit which causes the screw to compress as load increases. In Kollmorgen cylinders this limit is a function of unsupported leadscrew length. Exceeding this limit will cause the ballscrew to buckle and become permanently damaged.

Determining the Limits

Critical Speed and Column Loading information for each screw type (i.e. 2B, 5A, 8A, 5B ...) can be found at the bottom of each Performance Curve page for that particular linear actuator size.

Example

Find the Column Load and Critical Speed limits for an EC3-AKM42G-xxx-10-10B to the right. Reading off the chart, the column loading limit exceeds this system's performance envelope for all stroke lengths. The critical speed limit will begin interfering with the intermittent envelope for stroke lengths greater than 300 mm. The usable speed/thrust is restricted to less than these values as seen in the modified speed vs. thrust curve.

EC3-AKM42G-xxx-10-10B/ AKD (6 A)

Environmental Considerations

Environmental conditions are an important design consideration when selecting a Kollmorgen Linear Actuator. Kollmorgen units are self-contained systems which are protected from "direct contact" with harsh environments by an aluminum housing with a durable anodized and epoxy coated surface finish. However, extreme conditions can have an adverse effect on cylinder operation and life. Factors such as extreme temperature, liquids or abrasive contaminants (gaining internal access) can impede performance and cause premature wear of mechanical parts. Review the information below when sizing your application to choose appropriate options or protective measures.

Primary Environmental Factors

- Temperature
- Liquid contaminants
- Particle contaminants

Rod Type

Temperature

- N2 electric cylinders are rated for use between 0 and 60°C (32 to 140°F).
- EC electric cylinders are rated for use between -30 and 70°C (-22 to 158°F)

Particle and Liquid Contaminants

- N2 series electric cylinders are protected against dust but are not protected against direct water (or any liquid) contact. Liquid or moisture can gain access into the housing, eventually corroding internal components.
- EC electric cylinders are sealed and gasketed and are rated to IP54. They are protected against dust and light water sprays and splashing.

Protective Boot Option

The PB option is available for EC electric cylinders and increases the positioner's resistance to liquids. The diagram to the right shows a typical installation of an EC with the PB option. This option protects the actuator to IP65. Note that some motor options are not protected to this level. The PB option is not available with R-series Rodless positioners.

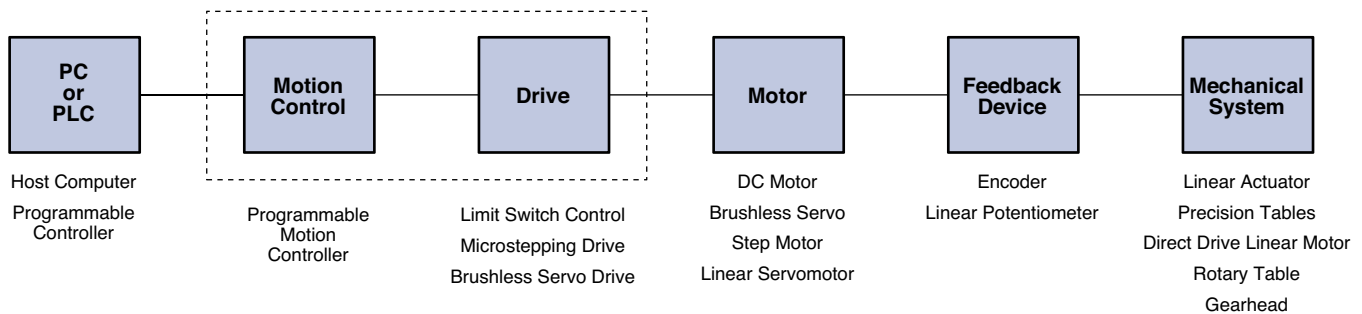

Custom Environmental Options

Kollmorgen has over 30 years experience designing custom linear actuators. We have designed fully encapsulated linear actuators for Corrosive, Food Processing, and Washdown environments, and have experience designing for Cleanroom compatible environments. Call Kollmorgen for more information regarding Custom environmental options.

Introduction to Motion Control

Many different components are used in a variety of combinations to create a complete motion control or positioning system. Kollmorgen offers the broadest range of products spanning the complete spectrum from mechanical linear positioners to microstepping and brushless servo drives to programmable motion controllers. A successful application depends on choosing the right combination of positioner, motor, drive, and control technology. More than one technology may meet the requirements of your application. In this case, factors such as performance, cost, flexibility, and simplicity may determine your selection.

Glossary of Motion Control Terminology

Absolute Move

A move referenced from a fixed absolute zero position.

Acceleration

The change in velocity as a function of time, going from a lower speed to a higher speed.

Accuracy

An absolute measurement defining the difference between expected and actual position.

Lead Screw

A screw which uses a threaded screw design with sliding surfaces between the screw and nut.

Backdrive

Tendency of a cylinder to creep out of its set position due to an applied load or force.

Backlash

The amount of play (lost motion) between a set of moveable parts when changing the direction of travel. Typically seen in drive trains, ball/lead screws, & bearings.

Ball screw

A screw assembly which uses a ball nut which houses one or more circuits of recirculating steel balls which roll between the nut and screw.

Bearing

A support device which allows a smooth, low friction motion between two surfaces loaded against each other.

Bushing

A cylindrical metal sleeve inserted into a machine part to reduce friction between moving parts.

Closed Loop

A positioning system which employs feedback information to regulate the output response.

Cogging

Motor torque variations which occur at low speeds due to a weak magnetic field.

Critical Speed

Rotational speed of a ball screw at which vibrations (whipping) will occur.

Current

The flow of charge through a conductor.

Cycle

One complete extension and retraction of a positioner.

Deceleration

The change in velocity as a function of time, going from a higher speed to a lower speed.

Drive Ratio

The ratio of motor revolutions per ball/lead screws revolution.

Drive Train

The arrangement by which the motor is coupled to the ball/lead screws. Typically provided by gears, timing belt/pulley or direct coupling.

Duty Cycle

The ratio of motor on time and total cycle time within a given cycle of operation.

$$\text{Duty Cycle (\%)} = \frac{\text{Motor ON Time}}{\text{Total Cycle Time}} \times 100$$

Dwell Time

Time within a move cycle where no motion occurs.

Efficiency

Ratio of output power vs. input power.

Electric Cylinder

A self contained system which converts rotary motion (from a motor) to linear motion.

Encoder

An electromechanical device which produces discrete electrical pulses directly related to the angular position of the input shaft, providing high resolution feedback data on position, velocity, and direction.

Force

The action of one body on another which tends to change the state of motion of that body. Typically described in terms of magnitude, direction, and point of application.

Friction

The resistance to motion of two surfaces that touch.

Helical Gear

Gears with teeth that spiral around the gear.

Incremental Move

A move referenced from the current set position.

Inertia

Property of an object that resists a change in motion. It is dependent on the mass and shape of the object. The greater an object's mass, the greater its inertia, and the more force is necessary to accelerate and decelerate.

Lead

The linear distance a nut will travel with one revolution of the Ball / Lead Screw.

Screw Assembly

Device which converts rotary motion to linear motion.

Mass

The quantity of matter that an object contains.

Microprocessor

A device that incorporates many or all functions of a computer in a single integrated circuit. Used to perform calculations and logic required to do motion or process control.

Moment (Load)

Rotational forces applied to a linear axis, typically expressed as yaw, pitch, and roll.

Motion Profile

A method of describing a move operation in terms of time, position, and velocity. Typically velocity is characterized as a function of time or distance which results in a triangular or trapezoidal profile.

Motor

A device which converts electrical energy into mechanical energy.

Non-Volatile Memory

Memory that does not lose information on loss of power.

Open Loop

A positioning system which does not employ feedback information.

Overshoot

The amount by which a parameter being controlled exceeds the desired value. Typically referring to velocity or position in servo systems.

Pitch

The number of revolutions a Ball / Lead Screw must turn for the nut to travel one inch (single start only).

PLC (Programmable Logic Controller)

A programmable device which utilizes "ladder" logic to control a bank of inputs and outputs which are interfaced to external devices.

Power

How much work is done in a specific amount of time.

Repeatability

The ability of a positioning system to return to an exact location during operation (from the same direction with the same load and speed).

Resistance

The opposition to the flow of charge through a conductor.

Resolution

The smallest positioning increment achievable. In digitally programmed systems it is the smallest specifiable positioning increment.

Resonance

Oscillatory behavior in a mechanical body when operated or subjected to a periodic force occurring at its natural frequency.

RS232C

A method of Serial Communication where data is encoded and transmitted on a single line in a sequential time format.

Servo Motor

A motor which is used in closed loop systems where feedback is used to control motor velocity, position, or torque.

Stepper Motor

Motor which translates electrical pulses into precise mechanical movements. Through appropriate drive circuitry, controlling the rate and quantity of pulses will control the motor's velocity and position.

Thrust

The measurement of linear force.

Torque

A measure of angular force which produces rotational motion.

Velocity (Speed)

The change in position as a function of time.

Voltage

Difference in electrical potential between two points.

Weight

Force of gravity acting on a body. Determined by multiplying the mass of the object by the acceleration due to gravity.

Model Nomenclature

N2 Series Electric Cylinder with AKM Servo Motors

N2 – AKM23D – BNC – 15 – 5B – 8 – MP2 – FT1M – () – CO

N2 Series

Motor Type*

AKM23D = AKM23D-EFxxx-00 brushless servo

AKM23C = AKM23C-EFxxx-00 brushless servo

Motor Options

Bxx = Rotatable IP65 connectors

Cxx = 0.5 m shielded cables w/ IP65 connectors

xNx = No brake

x2x = 24 Vdc power-off holding brake

xxR = Resolver

xx2 = 2048 LPR incremental comm. encoder

xxC = Smart Feedback Device (SFD)

Drive Ratio

10 = 1.0:1 drive belt/pulley

10L = 1.0:1 inline coupling (direct 1:1 coupling
is the only ratio available for inline models)

15 = 1.5:1 drive belt/pulley

20 = 2.0:1 drive belt/pulley

25 = 2.5:1 helical gears

Screw Pitch, Type

2B = 2 rev/inch ballscrew

5B = 5 rev/inch ballscrew

5A = 5 rev/inch lead screw

8A = 8 rev/inch lead screw

Stroke Length**

2 = 2 inch total stroke

4 = 4 inch total stroke

6 = 6 inch total stroke

8 = 8 inch total stroke

12 = 12 inch total stroke

18 = 18 inch total stroke (requires -DB option, effective stroke is 16.5")

24 = 24 inch total stroke (requires -DB option, effective stroke is 22.5")

nn.n = Custom stroke lengths available in 0.1 inch increments

Cable

CO = No cable supplied, motor includes connectors.
Default for all AKM servo motors; select
Kollmorgen cables based on motor/drive pairings.

Options***

(add multiple in the following sequence,
omit if no option required)

BS24 = 24 Vdc brake on lead screw
(not available with 10L ratio, or with MF2,
MF3, MS2, MP2, MP3 mounting options)

DB = Dual rod end bearing

PB = Protective boot

W = Water resistant

F = Sub-freezing temperature

H = High temperature prep

L = Linear potentiometer
(only for valid std. lengths)

Rod Ends

FC2 = Clevis (includes MT1M)

FE2 = Female eye rod end

FS2 = Spherical joint (includes FT1M)

FT1M = Female thread (metric)

FT1E = Female thread (English)

MT1M = Male thread (metric)

MT1E = Male thread (English)

Cylinder Mounting

MF1 = Front rectangular flange

MF2 = Rear rectangular flange

MF3 = Front & rear rectangular flange

MP2 = Rear double clevis without pivot base

MP3 = Rear double clevis with pivot base

MS1 = Side end angle

MS2 = Side lugs

MS6M = Side tapped holes (metric)

MS6E = Side tapped holes (English)

MT4 = Trunion

* Contact customer support for AKM combinations outside of those listed.

** For custom lengths round up to next standard incremental plus add standard cut fee.

*** Contact customer support for non-standard pricing and lead times.

Note: Options shown in blue text are considered standard.

Note: Options shown in bold blue text are considered standard.

Electric Cylinder Option Details

1-5 Base Model Number

Choose the model with sufficient speed and thrust with a comfortable safety margin. Refer to the Speed vs. Thrust curves.

EC cylinders with gear or timing belt drive reductions have the motor mounted parallel to the screw. Inline models have the motor coupled directly to the screw with no reduction.

6. Stroke Length

Standard lengths are listed, and custom lengths are also available. To maximize cylinder life, the thrust tube should not impact the physical end-of-travel on either end. Extra travel length is necessary to decelerate the load to a stop when an end-of-travel limit switch is encountered. This extra travel distance depends on load and speed.

7. Cylinder Mounting

Specify any one of these cylinder mounting options. Dimensional drawings are on pages 40-45.

Cylinder base mount options -MS1, -MP2, -MP3, -MF2, -MF3 cannot be ordered with inline models.

MF1 Front Flange
MF2 Rear Flange
MF3 Both Flanges

MS1 Side End Angles

MS2 Side Lugs

MP3 Rear Clevis
(MP2 omits pivot base)

MT4 Trunnion

Pivot Mount Caution:

When utilizing a pivot mounting option (MP2, MP3 or MT4) in conjunction with a pivot rod end (FS2 or FC2), it is recommended that the electric cylinder be extended only to 90–95% of its full stroke. This increases the system's rigidity and extends the life of the guide bearings and rod seal.

8. Rod Ends

Four rod end types are available:

FT1M or FT1E
Female Thread

MT1M or MT1E
Male Thread

FS2 Spherical Joint

FC2 Clevis

9. Other Options

See Options and Accessories Section for complete specifications.

* Limit sensors are sold as accessories

EC1 Series Position Sensors

Hall Effect Sensors (NPN)	
Part Number	Description
EC1-18N	Hall effect switch (NPN, normally open), without cable
EC1-18N-NC	Hall effect switch (NPN, normally closed), without cable
EC1-18N-03	Hall effect switch (NPN, normally open), 3 m leads
EC1-18N-NC-03	Hall effect switch (NPN, normally closed), 3 m leads
EC1-18N-QD	Hall effect switch (NPN, normally open), 150 mm quick disconnect cable
EC1-18N-NC-QD	Hall effect switch (NPN, normally closed), 150 mm quick disconnect cable

Hall Effect Sensor (PNP)	
Part Number	Description
EC1-18P	Hall effect switch (PNP, normally open), without cable
EC1-18P-NC	Hall effect switch (PNP, normally closed), without cable
EC1-18P-03	Hall effect switch (PNP, normally open), 3 m leads
EC 1-18P-NC-03	Hall effect switch (PNP, normally closed), 3 m leads
EC1-18P-QD	Hall effect switch (PNP, normally open), 150 mm quick disconnect cable
EC1-18P-NC-QD	Hall effect switch (PNP, normally closed), 150 mm quick disconnect cable

Spare Cables	
Part Number	Description
QPS-4M	Spare quick disconnect cable, 4 m
QPS-9M	Spare quick disconnect cable, 9 m

N2/EC2-EC5 Series Position Sensors

Magnetic Reed Switches	
Part Number	Description
PSR-1	Magnetic reed switch (normally open), 3 m leads
PSR-2	Magnetic reed switch (normally closed), 3 m leads
PSR-1Q	Magnetic reed switch (normally open), 4 m quick disconnect
PSR-2Q	Magnetic reed switch (normally closed), 4 m quick disconnect
PSR-1Q-NC	Magnetic reed switch (normally open), without cable
PSR-2Q-NC	Magnetic reed switch (normally closed), without cable
PSR-1Q-C9M	Magnetic reed switch (normally open), 9 m quick disconnect
PSR-2Q-C9M	Magnetic reed switch (normally closed), 9 m quick disconnect

Hall Effect Sensors (NPN)	
Part Number	Description
PSN-1	Hall effect switch (NPN, normally open), 3 m leads
PSN-2	Hall effect switch (NPN, normally closed), 3 m leads
PSN-1Q	Hall effect switch (NPN, normally open), 4 m quick disconnect
PSN-2Q	Hall effect switch (NPN, normally closed), 4 m quick disconnect
PSN-1Q-NC	Hall effect switch (NPN, normally open), without cable
PSN-2Q-NC	Hall effect switch (NPN, normally closed), without cable
PSN-1Q-C9M	Hall effect switch (NPN, normally open), 9 m quick disconnect
PSN-2Q-C9M	Hall effect switch (NPN, normally closed), 9 m quick disconnect

Hall Effect Sensor (PNP)	
Part Number	Description
PSP-1	Hall effect switch (PNP, normally open), 3 m leads
PSP-2	Hall effect switch (PNP, normally closed), 3 m leads
PSP-1Q	Hall effect switch (PNP, normally open), 4 m quick disconnect
PSP-2Q	Hall effect switch (PNP, normally closed), 4 m quick disconnect
PSP-1Q-NC	Hall effect switch (PNP, normally open), without cable
PSP-2Q-NC	Hall effect switch (PNP, normally closed), without cable
PSP-1Q-C9M	Hall effect switch (PNP, normally open), 9 m quick disconnect
PSP-2Q-C9M	Hall effect switch (PNP, normally closed), 9 m quick disconnect

MOTIONEERING® Online

MOTIONEERING® Online – Kollmorgen has revamped, modernized and put online one of the most respected applications sizing programs of the last 20 years. You now can access this application sizing and selection tool wherever you have access to the internet. MOTIONEERING Online is just a start of a series of releases that will empower you to optimize solutions for your toughest applications. Sizing frameless motors and drive systems has never been easier. Using a mechanism project concept for collecting and saving multiple axes of load information, MOTIONEERING® Online can automatically calculate application results and compare against a catalog of systems - recommending the most optimized set of Kollmorgen system solutions available.

Versatile units-of-measure selection options for mechanism and motion profile data-entry, with the ability to convert data into other available units, makes this a convenient international tool. A user-friendly Help file teaches program functions and algorithms used to provide results.

Mechanism Projects

- Direct drive entry, lead screw, conveyor
- Rack and pinion, nip rolls
- Direct Drive Rotary
- Electric Cylinder
- Direct data entry

Solution Set Search Screen

- Color-coded indication of system's ability to meet application requirements
- Review system components specifications
- Save, print, or create a pdf application report
- Evaluate system performance curve with application points

MOTIONEERING® Online Features:

- Inertia Calculator - lets you build up inertia based on odd shapes by additive or subtractive methods
- Custom Motion Profile - easy to add entire segments or copy segments to repeat
- Environmental Factor - takes into account your ambient temperature
- Project by Project Units - You can tailor your units on a project by project basis, or use the global units settings

MOTIONEERING Online Supported Browsers

- IE, Chrome, Firefox, Safari

About Kollmorgen

Since its founding in 1916, Kollmorgen's innovative solutions have brought big ideas to life, kept the world safer, and improved peoples' lives. Today, its world-class knowledge of motion systems and components, industry-leading quality, and deep expertise in linking and integrating standard and custom products continually delivers breakthrough motion solutions that are unmatched in performance, reliability, and ease-of-use. This gives machine builders around the world an irrefutable marketplace advantage and provides their customers with ultimate peace-of-mind.
